Artwork Explanation in Large-scale Vision Language Models

Anonymous ACL submission

Abstract

Large-scale vision-language models (LVLMs) output text from images and instructions, demonstrating advanced capabilities in text generation and comprehension. However, it has not been clarified to what extent LVLMs understand the knowledge necessary for explaining images, the complex relationships between various pieces of knowledge, and how they integrate these understandings into their explanations. To address this issue, we propose a new task: the artwork explanation generation task, along with its evaluation dataset and metric for quantitatively assessing the understanding and utilization of knowledge about artworks. This task is apt for image description based on the premise that LVLMs are expected to have pre-existing knowledge of artworks, which are often subjects of wide recognition and documented information. It consists of two parts: generating explanations from both images and titles of artworks, and generating explanations using only images, thus evaluating the LVLMs' language-based and vision-based knowledge. Alongside, we release a training dataset for LVLMs to learn explanations that incorporate knowledge about artworks. Our findings indicate that LVLMs not only struggle with integrating language and visual information but also exhibit a more pronounced limitation in acquiring knowledge from images alone[1].

1 Introduction

In the field of Vision & Language (V&L), Large Language Models (LLMs) (Touvron et al., 2023; Chiang et al., 2023; Bai et al., 2023a; Jiang et al., 2023) have been combined with visual encoders to create Large Scale Vision Language Models (LVLMs) (Li et al., 2023b; Liu et al., 2024; Bai et al., 2023b; Ye et al., 2023b). These models have achieved success in various V&L benchmarks (Li et al., 2023a; Fu et al., 2023; Liu et al., 2023c; Bai et al., 2023c). Despite these advancements, tasks like Visual Question Answering (VQA) (Zhang et al., 2022b; Yue et al., 2023) and querying models about artwork-related information (Garcia et al., 2020; Cetinic, 2021) have primarily focused on assessing models' abilities to handle isolated pieces of knowledge. Such tasks, while valuable, do not fully capture the complexity of synthesizing and explaining interconnected knowledge aspects inherent in real-world scenarios. A pertinent example of this limitation can be observed in the context of creative support for paintings and photographs. As shown in Figure 1, these models are required to produce explanations that systematically harness knowledge of the artwork's theme, historical context, associated works, and the artistic movement, demonstrating a gap in current capabilities. Since that is beyond simply recognizing disparate knowledge, it is crucial for LVLMs to deeply understand the interrelationships of artwork knowledge to integrate them into explanations comprehensively.

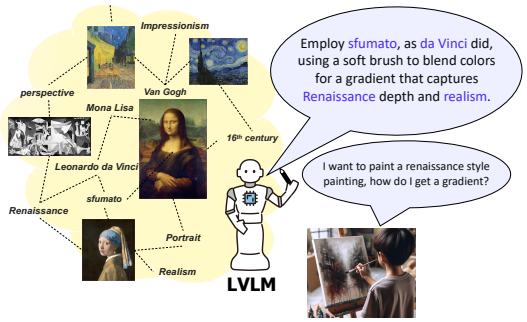

Figure 1: An example of creative assistance using an LVLM, harnessing comprehensive artistic knowledge for guidance.

To address this gap, we propose a new task and evaluation metrics designed to measure LVLMs' capability in generating comprehensive explanations about artworks. In our task, LVLMs must generate explanations in response to given instructions, based on the input images and titles of art-

[1]The datasets are available at `https://(anonymized)`

Type	Template	Instruction	Output
Section	Explain the {Section} of this artwork, {Title}.	Explain the History of this artwork, Mona Lisa.	Of Leonardo da Vinci's works, the Mona Lisa is the only portrait whose authenticity...
Subsection	Explain the {Subsection} regarding the {Section} of this artwork, {Title}.	Explain the Creation and date regarding the History of this artwork, Mona Lisa.	The record of an October 1517 visit by Louis d'Aragon states that the Mona Lisa...
Sub subsection	Explain the {Sub subection} details within the {Subsection} aspect of the {Section} in this artwork, {Title}.	Explain the Creation details within the Creation and date aspect of the History in this artwork, Mona Lisa.	After the French Revolution, the painting was moved to the Louvre, but spent a brief period in the bedroom of Napoleon (d. 1821) in the....

Table 1: Examples of instructions for the proposed task. The blue part indicates the artwork's title and the red part indicates the names of sections in the original Wikipedia articles that correspond to their explanations.

works. We have constructed a dataset from about 10,000 English Wikipedia articles of artworks for this task and also release a training dataset to facilitate LVLMs in learning to generate explanations involving artistic knowledge. Furthermore, we have evaluated LVLMs currently achieving the highest perforamnce in various V&L benchmarks. The results show that while the LVLMs retain the artistic knowledge inherited from their base LLMs, they do not adequately correlate this knowledge with the provided visual information.

2 LVLMs

LVLMs (Li et al., 2023b; Liu et al., 2024; Bai et al., 2023b; Ye et al., 2023b) integrate a Vision Encoder (Li et al., 2023b) trained through contrastive learning to process visual information with Large Language Models (LLMs) (Li et al., 2023b; Liu et al., 2024; Bai et al., 2023b; Ye et al., 2023b). This integration requires further training to effectively combine vision and language capabilities. As a result, these LVLMs outperform conventional pretrained models, even those with over ten times more parameters (et al, 2022; Driess et al., 2023).

However, it is unclear whether the LLM and the Vision Encoder knowledge are appropiately aligned by the additional network layers in LVLMs. Generating explanations that involve knowledge about art especially requires a careful and systematic alignment and utilization of the information from the Vision Encoder and the LLM. This challenge motivates us to design a new task for LVLMs.

3 Task and Evaluation Metrics

3.1 Task

Our task demands LVLMs to generate explanations following instructions with images and titles. Examples of the instructions are shown in Table1. As demonstrated by these examples, each instruction is categorized into three levels, Section, Subsection, and Subsubsection, determined by the corresponding positions in Wikipedia articles (See §4). The proposed task addresses the following two settings with or without titles:

With Title In the context of creative assistance, the title often contains the author's intent for the artwork, and it is desirable to generate explanations considering this intent. In this setting, both the image and its title are inputs, testing whether LVLMs can generate appropriate explanations based on both language and visual information.

Without Title As shown in Figure 1, there are cases, where a title does not exist potentially because the artwork is in the process of creation. This setting tests whether LVLMs can generate appropriate explanations using only visual information from images. Additionally, analyzing the performance changes with and without titles allows us to verify the LVLMs' pure vision-based knowledge.

Furthermore, in order to thoroughly assess the generalization capabilities of LVLMs, we compare two cases: 1) a seen case in which images are observed during training and 2) an unseen case.

3.2 Evaluation Metrics

Since our task is a kind of natural language generation (NLG), we utilize popular metrics in NLG for evaluation, i.e., BLEU (Papineni et al., 2002), ROUGE (Lin, 2004), and BERTScore (Zhang* et al., 2020). To further focus on the ability to generate explanations for artworks, we propose the following three evaluation metrics[2]:

- **Entity Coverage**: We evaluate how accurately the generated text includes entities (See §4) related to the artwork mentioned in the reference description, using two settings: exact match and partial match (Li et al., 2022).
- **Entity F1**: We evaluate the frequency of occurrence of entities related to the artwork found in the generated and reference explanations by F1. Inspired by ROUGE, we consider the highest frequency of occurrence of any entities within either

[2]For the formulas of each metric, see Appendix C.

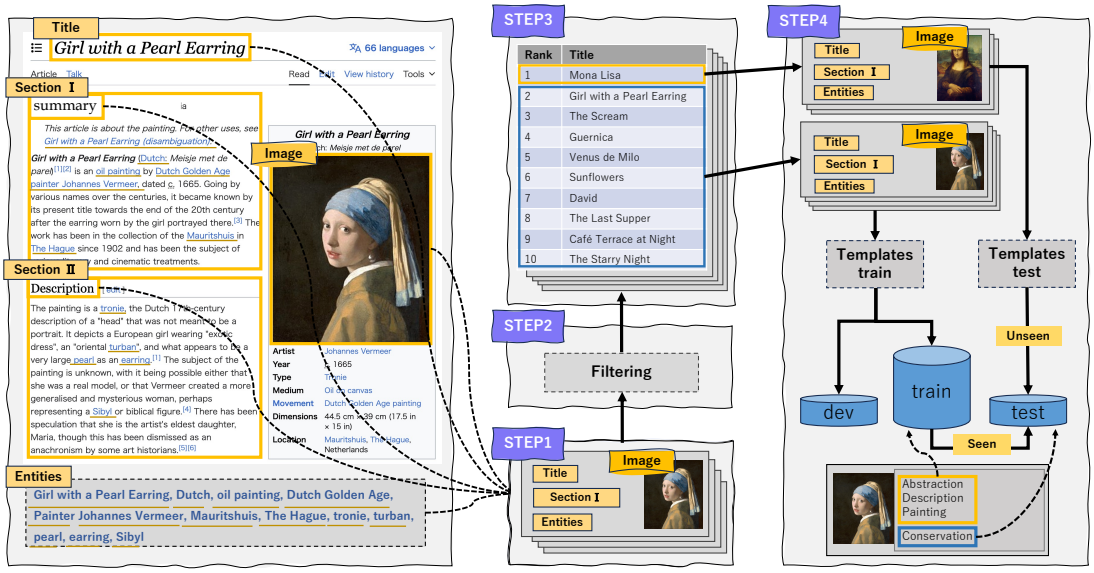

Figure 2: Workflow diagram illustrating the methodology for dataset creation from Wikipedia articles on artworks, involving selection, filtering, data balancing, and instructional templating for LVLM training and evaluation.

the generated explanation or the reference as the upper limit of occurrence frequency to calculate precision and recall.

- **Entity Cooccurrence**: This metric assesses not only the coverage of independent entities but also how their interrelations are contextually combined to form the overall explanation. Specifically, it considers pairs of entities that co-occur within a sentence and its preceding and following n sentences, evaluating the coverage rate of these pairs to reveal how well the model understands and integrates the relevance of knowledge. By setting the value of n to exceed the number of sentences in the generated explanation, it becomes possible to account for the co-occurrence of entity pairs throughout the entire text. Furthermore, we apply the brevity penalty used in BLEU (Papineni et al., 2002) to verify the accuracy of knowledge at an appropriate length.

4 Dataset Creation

The process of dataset creation, illustrated in Figure 2, involved the following steps:

- **STEP 1:** We collected all artwork articles from the English Wikipedia that have an infobox (about 10,000), divided them into sections, and created descriptive texts. Additionally, hyperlinked texts within the articles were extracted as entities related to artwork. Each descriptive text is accompanied by four pieces of information: the title, the hierarchy of sections (i.e., Section, Subsection, Subsubsection), the image, and the aforementioned entities.
- **STEP 2:** We excluded descriptions from sections unrelated to artwork explanations, articles without images, and articles not related to specific artworks.
- **STEP 3:** To prevent biases that may arise due to the notoriety of the artworks included in the LVLM's training data, we shuffled the data. First, we ranked the data using six metrics: page views, number of links, number of edits, number of references, number of language versions, and article length. We then evenly split the data into test, development, and training sets at a ratio of 1:1:8 to maintain the average ranking across these sets.
- **STEP 4:** The sorted data for each set were then formatted into instructions using the templates described in Section 3.1. To diversify the training data, we prepared seven different templates inspired by Longpre et al. (2023).

5 Evaluation

Setup We evaluated four models: mPLUG-Owl2 (Ye et al., 2023b), LLaVA-NeXT (Liu et al., 2024), Qwen-VL-Chat (Bai et al., 2023b), and GPT-4 Vision (OpenAI, 2023), along with an instruction-tuned version of Qwen-VL-Chat (FT), fine-tuned by our dataset with LoRA (Dettmers et al., 2022a).[3]

Results Table 2 shows the result. In the "With Title" setting, GPT-4-Vision achieved the highest performance in Entity Coverage and Entity F1, with Qwen-VL-Chat (FT), Qwen-VL-Chat, and LLaVA-NeXT (Yi-34B-Chat) also showing strong perfor-

[3]Further details for the evaluation setup and results for other models are described in Appendix D and Appendix A.

Table 3: Results of LLMs (Unseen[4]). Notations are the same as Table 2.

mance. Notably, Qwen-VL-Chat (FT) reached the highest precision in Entity Cooccurrence, showcasing its exceptional ability to accurately contextualize knowledge within generated text. This proves the superiority of our instruction-tuning dataset. Additionally, considering the average length of reference tokens is 174 in the unseen setting, the significantly low performance of LLaVA-Next (Yi-34B-Chat) indicates that excessive token lengths may result in redundant text, which is unsuitable for generating concise explanations.

In the "Without Title" setting, Qwen-VL-Chat (FT) outperformed GPT-4-Vision across all metrics, indicating that our dataset enables accurate knowledge association and generation from visual information. Comparative analysis of the models' performance in scenarios with and without titles indicated a consistent drop in performance across the board. This observation clearly shows the difficulties in generating text based solely on visual inputs, requiring a significant dependency on text-based cues across all models, including advanced ones like GPT-4-Vision.

[4]Since LLMs do not handle visual information, we conducted the analysis in a setting with titles.

We conduct further analysis on this aspect, and Table 3 shows the results of explanation generation in the With Title setting without images for text-only LLMs. The comparison of Tables 2 and 3 reveals how much of the text only LLM's knowledge is retained through the integrated learning of vision and language. Notably, Table 3 illustrates that GPT-4 (OpenAI et al., 2023) achieves the highest accuracy across all metrics, demonstrating strong knowledge about artworks, closely followed by Llama2 (Touvron et al., 2023), Vicuna (Chiang et al., 2023), and Yi-34-Chat (01.AI, 2023). Conversely, Qwen-Chat (Bai et al., 2023a) is shown to perform comparatively lower. Additionally, it is apparent that the knowledge about artworks is compromised in mPLUG-Owl2 and LLaVA-NeXT, GPT-4-Vision due to the integrated learning of vision and language. On the other hand, Qwen-VL-Chat achieves a 10% performance boost in titled settings, signaling successful synthesis of vision and language knowledge.

6 Conclusion

We introduced a new task, artwork explanation generation, and its dataset and metrics to quantitatively evaluate artistic knowledge comprehension and application. Using LVLMs, we assessed their retention and utilization of artworks knowledge from base LLMs, with or without artwork titles. Our findings indicate that while LVLMs maintain much of the artistic knowledge from their LLM counterparts, they do slightly lose some in practice. Furthermore, the challenges in generating text based solely on visual inputs clearly show a significant dependency on text-based cues.

Limitations

Our research elucidates the intricacies of integrating visual and language abilities within Large Scale Vision-Language Models (LVLMs), yet it encounters specific limitations that delineate the scope of our findings. A principal limitation emerges from the exclusive reliance on the inherently diverse authorship and open editing model of Wikipedia as our data source. Variations in the level of detail, writing style, and information density across artwork entries may lead to inconsistencies within the dataset, potentially skewing the models' performance and affecting the universality of our conclusions. Furthermore, this reliance inherently limits our dataset to well-known artworks, omitting lesser-known yet culturally significant works not featured on the platform, thereby missing out on a broader spectrum of artistic significance.

Simultaneously, our study identifies a crucial limitation in the process of integrating Vision Encoders with LLMs, particularly highlighting the models' reliance on textual cues to generate text from visual inputs. This observation underscores the difficulty of retaining language knowledge during the integration, a problem we acknowledge without offering concrete solutions. This gap clearly shows the pressing need for future research to not only further investigate these issues but also to develop innovative methodologies, such as advanced training techniques or new model architectures, that ensure the preservation of language knowledge amidst the integration of visual and language abilities.

Ethical Considerations

In our study, we meticulously curated our dataset derived from English Wikipedia. During the data creation phase, we individually inspected each extracted image, carefully removing those clearly unsuitable for public disclosure, ensuring no inappropriate images were included. Additionally, while English Wikipedia's editors actively eliminate unnecessarily offensive content to compile an encyclopedia, as outlined on their official pages regarding offensive material (https://en.wikipedia.org/wiki/Wikipedia:Offensive_material), bias in sources, and the use of biased or opinionated sources (https://en.wikipedia.org/wiki/Wikipedia:Neutral_point_of_view#Bias_in_sources, https://en.wikipedia.org/wiki/Wikipedia:Reliable_sources#Biased_or_opinionated_sources), it is acknowledged that English Wikipedia allows the inclusion of biased information sources. Consequently, our dataset might also reflect the inherent biases present in the original English Wikipedia content.

In this work, we used an AI assistant tool, ChatGPT, for coding support.

Table 4: Results of LVLMs including 'seen' settings. Notations are the same as Table 2.

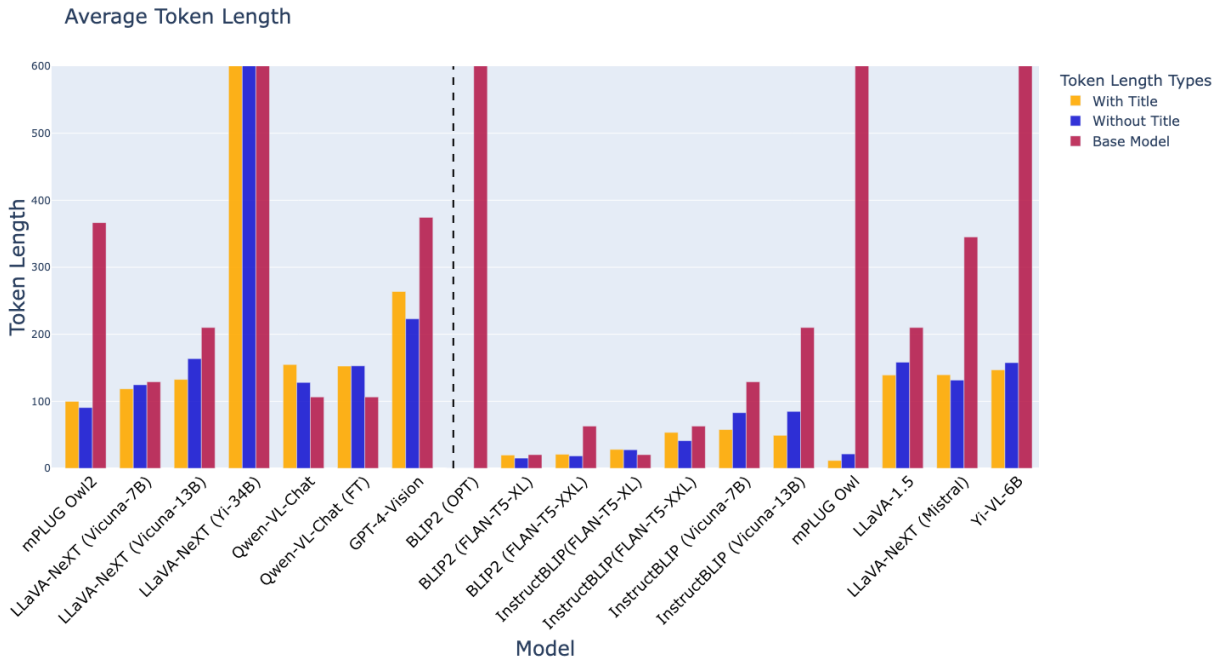

Figure 3: Average token lengths for 18 evaluated LVLMs on an unseen set, where yellow represents the 'With Title' setting, blue indicates the 'Without Title' setting, and red signifies the average token length for the base language model of the LVLM with titles. The length of the unseen reference sentence is 174 tokens.

A Supplemental Results

A.1 Detailed Evaluation of LVLMs in 'Seen' Data Settings

Table 4 presents the results of Language-Vision Learning Models (LVLMs) including 'seen' settings, with bold type highlighting the highest score for each metric within each group. In this study, we assessed the generalizability of data and the precision of models fine-tuned on 'seen' and 'unseen' data during their training phase to ascertain if the fine-tuning process enhanced the models' accuracy for images encountered during training. Despite the images being part of the training dataset, with sections meticulously segregated to prevent data leakage, our validation revealed no significant differences in accuracy between 'seen' and 'unseen' settings. This finding confirms the general applicability of the data and suggests that simply viewing images, without integrating them with relevant contextual knowledge, does not inherently contribute to accuracy improvement. This highlights the importance of a holistic learning approach where images are paired with pertinent information to truly boost the performance of the models.

A.2 Extended Analysis of Additional LVLMs

In our research, we expanded our experimental investigation beyond the models outlined in the primary section to include Blip2 (Li et al., 2023b), mPLUG_Owl (Ye et al., 2023a), LLaVA-NeXT (Mistral) (Liu et al., 2024), LLaVA-1.5 (Liu et al., 2023a,b), InstructBlip (Dai et al., 2023), and Yi-6B (01.AI, 2023), integrating image and language in a manner similar to the initially described models. Utilizing the same experimental framework as the initial tests, we conducted an thorough assessment. The results, as outlined in Table 5, revealed that these additional models did not exceed the accuracy levels of those featured in the main analysis (refer to Section 5). Additionally, a comparative examination of configurations with and without titles showed a uniform decline in efficacy, emphasizing the difficulty of deriving knowledge and translating it into explanatory text generation based purely on image data.

A.3 Detailed Performance Metrics for Base LLMs with Title Context

Table 6 presents the results of an evaluation involving the base LLM models of the Language-Vision Learning Models (LVLMs) discussed in Tables 2 and 5. This evaluation additionally included tests on base models such as FLAN-T5-XL(Chung et al., 2022), FLAN-T5-XXL, OPT(Zhang et al., 2022a), LLaMA(Touvron et al., 2023) Mistral(Jiang et al., 2023), and Yi-6B, which were not featured in the main analysis. Since Language Models (LMs) are incapable of processing image information, the evaluation was confined to the 'With Title' setting that incorporates textual information. Within this context, GPT-4 showcased superior performance across all tested configurations, with Mistral, Vicuna-13B, and LlaMA2 also demonstrating strong results.

Consistent with the data presented in Table 2, the base model for LLaVA-NeXT (Yi-34B) yielded output sequences with excessively token lengths compared to its counterparts, mirroring the behavior of its LVLM version. This tendency for producing longer output is illustrated when compared with other models (as depicted in Figure 3). Furthermore, when examining the accuracy of the LVLMs tested in Table 5 alongside the base models in relation to our task proposal, there is a discernible decline in precision across nearly all models. Qwen is the exception, which highlights the nuanced challenges in effectively merging image and textual data. This complexity stands as a pivotal challenge for the evolution of sophisticated LVLMs.

B Title generation

In our task, the titles of artworks are a crucial element of knowledge related to the artworks. To maintain the integrity of the analysis between the settings with and without titles setting, we intentionally omitted titles from entity recognition. However, we recognized the need to understand the performance of models in generating titles of artworks based solely on visual information. Therefore, We conducted an additional experiment in which we presented the models with the prompt **"Please answer the title of this artwork"** along with 963 images from the "Unseen" test set and evaluated the accuracy of title generation under two settings: Exact and Partial. Tables 7 and 8 display the accuracy results of the main models and those from additional experiments, respectively.

The results showed that GPT-4-Vision achieved the highest performance with an exact match setting at 8.97%, followed by Qwen-VL-Chat (FT) and Qwen-VL-Chat with good performances. Other models scored 2% or less, highlighting the

difficulty of generating titles. Additionally, none of the LLaVA-NeXT models were able to correctly generate a single title.

Furthermore, Table 9 shows the actual artwork titles generated by the top five models with the best accuracy in the exact match setting. The "Rank" in the table is used to distribute the dataset evenly at the time of its creation (refer to Section 4), between famous and less famous paintings, to prevent bias. From the table, we can infer that a higher proportion of famous artworks with higher ranks were generated, indicating that the models have a better grasp of more famous artworks.

C Evaluation Metrics Formulation

This section elaborates on the evaluation metrics proposed in Section 3.2 using mathematical expressions. An explanation consisting of n sentences generated by the model is denoted as $G = \{g_1, \cdots, g_n\}$, and a reference explanation consisting of m sentences is denoted as $R = \{r_1, \cdots, r_m\}$. The function Entity$(\cdot)$ is defined to extract entities contained in the input text. The notation $|G|$ represents the total number of tokens in the generated explanation, and $|R|$ represents the total number of tokens in the reference explanation.

Entity Coverage (EC) is calculated as follows:

$$EC(G, R) = Cov(G, R) \quad (1)$$

Here, $Cov(G, R)$ is a function returning the proportion of entities in R that are covered by G. For partial matches, the Lowest Common Subsequence (LCS) is employed to calculate the longest matching length ratio in the generated explanation relative to the length of the reference entity.

Entity F1 (EF$_1$) is computed as follows:

$$EF_1 = \frac{2 \times P \times R}{P + R} \quad (2)$$

$$P = \frac{\sum_{e_i \in Entity(G)} \text{Count}_{\text{clip}}(e_i, G, R)}{\sum_{e_j \in Entity(G)} \#(e_j, G)} \quad (3)$$

$$R = \frac{\sum_{e_i \in Entity(R)} \text{Count}_{\text{clip}}(e_i, G, R)}{\sum_{e_j \in Entity(R)} \#(e_j, R)}, \quad (4)$$

where $\#(e_j, G)$, $\#(e_j, R)$ are functions that count the occurrences of entity e_j in G and R respectively, and $\text{Count}_{\text{clip}}(e_i, G, R)$ returns the lesser frequency of occurrence of e_i in either G or R.

Entity Cooccurrence (ECooc) is calculated using BP from equation (6) as follows:

$$\begin{aligned} &ECooc(G, R) \\ =&BP(G, R) \times Cov(Co(G), Co(R)), \end{aligned} \quad (5)$$

where $BP(G, R)$ is given by:

$$BP(G, R) = \exp(\max(0.0, \frac{|G|}{|R|} - 1)) \quad (6)$$

and function $Co(\cdot)$ returns pairs of co-occurring entities within a context window comprising a sentence and its adjacent n sentences. Sentence segmentation was performed using the nltk sentence splitter for this purpose.[5]

D.3 Fine tunning and Inference setting

In this study, to ensure a fair comparison of performance across multiple models, all experiments

[5] Sentence segmentation was performed using the NLTK sentence splitter.

Hyper Parameter	Value
torch_dtype	bfloat16
seed	42
max length	2048
warmup ratio	0.01
learning rate	1e-5
batch size	4
epoch	1
lora r	64
lora alpha	16
lora dropout	0.05
lora target modules	c_attn, attn.c_proj, w1, w2

Table 10: The hyper-parameters used in the experiment, and others, were set to default settings. The implementation used Transformers (Wolf et al., 2020) and bitsandbytes (Dettmers et al., 2022b).

	Train	Dev	Test (Seen)	Test (Unseen)
Images	7704	963	2407	963
Instruction	19181	2726	2563	2664

Table 11: Number of Images and Data in the Created Dataset

were conducted on a single NVIDIA RTX 6000 Ada GPU, with 8-bit quantization utilized for model generation. However, due to resource constraints, LLaVA-NeXT (Yi-34B-Chat) model was loaded and inferred in 4-bit mode. To standardize the length of tokens generated across all models, the maximum token length was set to 1024. The same settings were applied to each model for performance comparison purposes.

E Details of our created dataset

E.1 Dataset section distribution

Table 12 provides a comprehensive breakdown of the various types of sections within the dataset, along with their frequency counts. In designing the test set for the "seen" setting, we meticulously considered the distribution of these sections. Through an analysis of the frequency of each section type, we managed to evenly split the data. This strategic approach ensured that the test set was constructed with a balanced representation of each section type, aiming for a more equitable and thorough evaluation process. Due to this methodology, the division of the test set into "seen" and "unseen" portions was based on the distribution of section types, rather than the number of images. Consequently, the number of images in the "seen" and "unseen" parts of the test set may not be equal (refer to Table 11). This was a deliberate choice to prioritize a balanced representation of section types over an equal count of images, enhancing the relevance and fairness of the evaluation process.

E.2 Omitted sections

The following sections have been omitted from this document:

References, See also, External links, Sources, Further reading, Bibliography, Gallery, Footnotes, Notes References, References Sources, Bibliography (In Spanish), Bibliography (In Italian), Bibliography (In German), Bibliography (In French), Images, Note, Links, Notes, List, Notes and references, List by location

These sections were deemed unsuitable for the task of generating descriptions of artwork in this study and were therefore removed.

E.3 Train templates

Table 13: Prompt Templates

Type	Template
Template 1	
Section	Focus on **{title}** and explore the {section}.
Subsection	In the context of **{title}**, explore the {subsection} of the {section}.
Sub subsection	Focusing on the {section} of **{title}**, explore the {subsubsection} about the {subsection}.
Template 2	
Section	Focus on **{title}** and explain the {section}.
Subsection	In the context of **{title}**, explain the {subsection} of the {section}.
Sub subsection	Focusing on the {section} of **{title}**, explain the {subsubsection} about the {subsection}.
Template 3	
Section	Explore the {section} of this artwork, **{title}**.
Subsection	Explore the {subsection} about the {section} of this artwork, **{title}**.
Sub subsection	Explore the {subsubsection} about the {subsection} of the {section} in this artwork, **{title}**.
Template 4	
Section	Focus on **{title}** and discuss the {section}.
Subsection	In the context of **{title}**, discuss the {subsection} of the {section}.
Sub subsection	Focusing on the {section} of **{title}**, discuss the {subsubsection} about the {subsection}.
Template 5	
Section	How does **{title}** elucidate its {section}?
Subsection	In **{title}**, how is the {subsection} of the {section} elucidated?
Sub subsection	Regarding **{title}**, how does the {section}'s {subsection} incorporate the {subsubsection}?
Template 6	
Section	Focus on **{title}** and analyze the {section}.
Subsection	In the context of **{title}**, analyze the {subsection} of the {section}.
Sub subsection	Focusing on the {section} of **{title}**, analyze the {subsubsection} about the {subsection}.
Template 7	
Section	In **{title}**, how is the {section} discussed?
Subsection	Describe the characteristics of the {subsection} in **{title}**'s {section}.
Sub subsection	When looking at the {section} of **{title}**, how do you discuss its {subsection}'s {subsubsection}?

E.4 Train dataset examples

The following examples illustrate two different formats of the training dataset. The first includes a 'title' field, while the second does not.

Dataset Example (with Title)

```
{
  "id": "0001_T",
  "title": "Mona Lisa",
  "conversations": [
    {
      "from": "user",
      "value": "<img>/images/Mona Lisa.jpg</img>\nFocus on Mona Lisa and explore the history."
    },
    {
      "from": "assistant",
      "value": "Of Leonardo da Vincis works, the Mona Lisa is the only portrait whose authenticity...."
    }
  ]
}
```

Dataset Example (without Title)

```
{
  "id": "0001_NT",
  "conversations": [
    {
      "from": "user",
      "value": "<img>/images/Mona Lisa.jpg</img>\nFocus on this artwork and explore the history."
    },
    {
      "from": "assistant",
      "value": "Of Leonardo da Vincis works, the Mona Lisa is the only portrait whose authenticity...."
    }
  ]
}
```

E.5 License

In our study we created a dataset from Wikipedia articles of artworks. The each image is available under the Creative Commons License (CC) or other licenses. Specific license information for each image can be found on the Wikipedia page or the image description page for that image. The images in this study are used under the terms of these licenses, and links to the images are provided in the datasets we publish so that users can download the images directly. The images themselves are not directly published. Therefore, our data does not infringe upon the licenses.
