

A PROOF

Lemma 1. *The binary relation $\preceq_{(Z)}$ defined in Eq. (7) is transitive, i.e., $\forall \mathbf{x}, \mathbf{y}, \mathbf{w} \in X, F(\mathbf{x}) \preceq_{(Z)} F(\mathbf{y}) \wedge F(\mathbf{y}) \preceq_{(Z)} F(\mathbf{w}) \Rightarrow F(\mathbf{x}) \preceq_{(Z)} F(\mathbf{w})$.*

Proof of Lemma 1. According to Eq. (7),

$$\begin{aligned} F(\mathbf{x}) \preceq_{(Z)} F(\mathbf{y}) \wedge F(\mathbf{y}) \preceq_{(Z)} F(\mathbf{w}) &\Rightarrow \\ (F(\mathbf{x}) \prec_{(Z)} F(\mathbf{y}) \vee F(\mathbf{x}) =_{(Z)} F(\mathbf{y})) \wedge (F(\mathbf{y}) \prec_{(Z)} F(\mathbf{w}) \vee F(\mathbf{y}) =_{(Z)} F(\mathbf{w})) &\Rightarrow \\ \underbrace{(F(\mathbf{x}) =_{(Z)} F(\mathbf{y}) \wedge F(\mathbf{y}) =_{(Z)} F(\mathbf{w}))}_{i} \vee \underbrace{(F(\mathbf{x}) \prec_{(Z)} F(\mathbf{y}) \wedge F(\mathbf{y}) \prec_{(Z)} F(\mathbf{w}))}_{ii} & \\ \vee \underbrace{(F(\mathbf{x}) =_{(Z)} F(\mathbf{y}) \wedge F(\mathbf{y}) \prec_{(Z)} F(\mathbf{w}))}_{iii} \vee \underbrace{(F(\mathbf{x}) \prec_{(Z)} F(\mathbf{y}) \wedge F(\mathbf{y}) =_{(Z)} F(\mathbf{w}))}_{iv} & \end{aligned} \quad (9)$$

Statement I: $F(\mathbf{x}) =_{(Z)} F(\mathbf{y}) \wedge F(\mathbf{y}) =_{(Z)} F(\mathbf{w}) \Rightarrow F(\mathbf{x}) =_{(Z)} F(\mathbf{w})$.

Proof of Statement I. From Eq. (5), we have,

$$\begin{aligned} F(\mathbf{x}) =_{(Z)} F(\mathbf{y}) \wedge F(\mathbf{y}) =_{(Z)} F(\mathbf{w}) &\Rightarrow \\ \left(f^k(\mathbf{x}) = f^k(\mathbf{y}) \vee (f^k(\mathbf{x}) \leq z^k \wedge f^k(\mathbf{y}) \leq z^k), \forall k \in [K] \right) & \\ \wedge \left(f^k(\mathbf{y}) = f^k(\mathbf{w}) \vee (f^k(\mathbf{y}) \leq z^k \wedge f^k(\mathbf{w}) \leq z^k), \forall k \in [K] \right) & \\ \Rightarrow \forall k \in [K] : (f^k(\mathbf{x}) = f^k(\mathbf{y}) = f^k(\mathbf{w})) & \\ \vee ((f^k(\mathbf{x}) = f^k(\mathbf{y})) \wedge (f^k(\mathbf{y}) \leq z^k \wedge f^k(\mathbf{w}) \leq z^k)) & \quad (10) \\ \vee ((f^k(\mathbf{x}) \leq z^k \wedge f^k(\mathbf{y}) \leq z^k) \wedge (f^k(\mathbf{y}) = f^k(\mathbf{w}))) & \\ \vee ((f^k(\mathbf{x}) \leq z^k \wedge f^k(\mathbf{y}) \leq z^k \wedge f^k(\mathbf{w}) \leq z^k)) & \\ \Rightarrow ((f^k(\mathbf{x}) = f^k(\mathbf{w})) \vee (f^k(\mathbf{x}) \leq z^k \wedge f^k(\mathbf{w}) \leq z^k), \forall k \in [K]) & \\ \Rightarrow F(\mathbf{x}) =_{(Z)} F(\mathbf{w}) & \end{aligned}$$

Statement II: $F(\mathbf{x}) \prec_{(Z)} F(\mathbf{y}) \wedge F(\mathbf{y}) \prec_{(Z)} F(\mathbf{w}) \Rightarrow F(\mathbf{x}) \prec_{(Z)} F(\mathbf{w})$

Proof of Statement II. According to Eq. (5), we have

$$\begin{aligned} F(\mathbf{x}) \prec_{(Z)} F(\mathbf{y}) &\Leftrightarrow \\ \exists k_1 \in [K] : f^{k_1}(\mathbf{x}) < f^{k_1}(\mathbf{y}) \wedge f^{k_1}(\mathbf{y}) > z^{k_1} \wedge F^{k_1-1}(\mathbf{x}) =_{(Z)} F^{k_1-1}(\mathbf{y}) & \quad (11) \\ F(\mathbf{y}) \prec_{(Z)} F(\mathbf{w}) &\Leftrightarrow \\ \exists k_2 \in [K] : f^{k_2}(\mathbf{y}) < f^{k_2}(\mathbf{w}) \wedge f^{k_2}(\mathbf{w}) > z^{k_2} \wedge F^{k_2-1}(\mathbf{y}) =_{(Z)} F^{k_2-1}(\mathbf{w}) & \end{aligned}$$

Let $k' = \min\{k_1, k_2\}$, according to Statement I and Eq. (11), we have:

$$(F^{k'-1}(\mathbf{x}) =_{(Z)} F^{k'-1}(\mathbf{y})) \wedge (F^{k'-1}(\mathbf{y}) =_{(Z)} F^{k'-1}(\mathbf{w})) \Rightarrow F^{k'-1}(\mathbf{x}) =_{(Z)} F^{k'-1}(\mathbf{w}) \quad (12)$$

According to Eq. (12), if $k' = k_1 < k_2$, we have

$$(f^{k'}(\mathbf{x}) < f^{k'}(\mathbf{y}) = f^{k'}(\mathbf{w})) \wedge (z^{k'} < f^{k'}(\mathbf{y}) = f^{k'}(\mathbf{w})) \quad (13)$$

If $k' = k_2 < k_1$, we have

$$(f^{k'}(\mathbf{x}) = f^{k'}(\mathbf{y}) < f^{k'}(\mathbf{w})) \wedge (z^{k'} < f^{k'}(\mathbf{w})) \quad (14)$$

Otherwise when $k' = k_1 = k_2$, we have

$$\left(f^{k'}(\mathbf{x}) < f^{k'}(\mathbf{y}) < f^{k'}(\mathbf{w}) \right) \wedge \left(z^{k'} < f^{k'}(\mathbf{y}) < f^{k'}(\mathbf{w}) \right) \quad (15)$$

Combing Eq. (12), Eq. (13), Eq. (14) and Eq. (15), we have found $k = k'$ such that $(f^k(\mathbf{x}) < f^k(\mathbf{w})) \wedge (f^k(\mathbf{w}) > z^k) \wedge (F^{k-1}(\mathbf{x}) =_{(Z)} F^{k-1}(\mathbf{w}))$.

Statement III: $F(\mathbf{x}) =_{(Z)} F(\mathbf{y}) \wedge F(\mathbf{y}) \prec_{(Z)} F(\mathbf{w}) \Rightarrow F(\mathbf{x}) \prec_{(Z)} F(\mathbf{w})$.

Proof of Statement III. According to the definitions of $=_{(Z)}$ and $\prec_{(Z)}$ in Eq. (5) and Eq. (6),

$$\begin{aligned} & \left(F(\mathbf{x}) =_{(Z)} F(\mathbf{y}) \right) \wedge \left(F(\mathbf{y}) \prec_{(Z)} F(\mathbf{w}) \right) \Rightarrow \\ & \left(\forall k_1 \in [K] : (f^{k_1}(\mathbf{x}) = f^{k_1}(\mathbf{y})) \vee (f^{k_1}(\mathbf{x}) \leq z^{k_1} \wedge f^{k_1}(\mathbf{y}) \leq z^{k_1}) \right) \\ & \wedge \left(\exists k_2 \in [K] : f^{k_2}(\mathbf{y}) < f^{k_2}(\mathbf{w}) \wedge f^{k_2}(\mathbf{w}) > z^{k_2} \wedge F^{k_2-1}(\mathbf{y}) =_{(Z)} F^{k_2-1}(\mathbf{w}) \right) \end{aligned} \quad (16)$$

According to the above propositions, we find a $k = k_2$, such that,

$$\begin{aligned} & \left((f^k(\mathbf{x}) = f^k(\mathbf{y}) < f^k(\mathbf{w})) \vee (f^k(\mathbf{x}) \leq z^k < f^k(\mathbf{w})) \right) \\ & \wedge \left(z^k < f^k(\mathbf{w}) \right) \wedge \left(F^{k-1}(\mathbf{x}) =_{(Z)} F^{k-1}(\mathbf{w}) \right) \\ & \Rightarrow \left(f^k(\mathbf{x}) < f^k(\mathbf{w}) \right) \wedge \left(z^k < f^k(\mathbf{w}) \right) \wedge \left(F^{k-1}(\mathbf{x}) =_{(Z)} F^{k-1}(\mathbf{w}) \right) \end{aligned} \quad (17)$$

in which indicates $F(\mathbf{x}) \prec_{(Z)} F(\mathbf{w})$.

Statement IV: $F(\mathbf{x}) \prec_{(Z)} F(\mathbf{y}) \wedge F(\mathbf{y}) =_{(Z)} F(\mathbf{w}) \Rightarrow F(\mathbf{x}) \prec_{(Z)} F(\mathbf{w})$.

Proof of Statement IV. According to the definitions of $=_{(Z)}$ and $\prec_{(Z)}$ in Eq. (5) and Eq. (6),

$$\begin{aligned} & \left(F(\mathbf{x}) \prec_{(Z)} F(\mathbf{y}) \right) \wedge \left(F(\mathbf{y}) =_{(Z)} F(\mathbf{w}) \right) \\ & \Rightarrow \left(\exists k_1 \in [K] : f^{k_1}(\mathbf{x}) < f^{k_1}(\mathbf{y}) \wedge f^{k_1}(\mathbf{y}) > z^{k_1} \wedge F^{k_1-1}(\mathbf{x}) =_{(Z)} F^{k_1-1}(\mathbf{y}) \right) \wedge \\ & \left(\forall k_2 \in [K] : (f^{k_2}(\mathbf{y}) = f^{k_2}(\mathbf{w})) \vee (f^{k_2}(\mathbf{y}) \leq z^{k_2} \wedge f^{k_2}(\mathbf{w}) \leq z^{k_2}) \right) \end{aligned} \quad (18)$$

Then, we can find a $k = k_1$, such that,

$$\begin{aligned} & \left(f^k(\mathbf{x}) < f^k(\mathbf{y}) = f^k(\mathbf{w}) \right) \wedge \left(z^k < f^k(\mathbf{w}) = f^k(\mathbf{y}) \right) \wedge \left(F^{k-1}(\mathbf{x}) =_{(Z)} F^{k-1}(\mathbf{w}) \right) \\ & \Rightarrow \left(f^k(\mathbf{x}) < f^k(\mathbf{w}) \right) \wedge \left(z^k < f^k(\mathbf{w}) \right) \wedge \left(F^{k-1}(\mathbf{x}) =_{(Z)} F^{k-1}(\mathbf{w}) \right) \Rightarrow F(\mathbf{x}) \prec_{(Z)} F(\mathbf{w}) \end{aligned} \quad (19)$$

By substituting the conclusions in statement (I), (II), (III) and (IV) into (i), (ii), (iii), and (iv) in Eq. (9) respectively, we get:

$$\begin{aligned} F(\mathbf{x}) \preceq_{(Z)} F(\mathbf{y}) \wedge F(\mathbf{y}) \preceq_{(Z)} F(\mathbf{w}) & \Rightarrow \left(F(\mathbf{x}) \prec_{(Z)} F(\mathbf{w}) \right) \vee \left(F(\mathbf{x}) =_{(Z)} F(\mathbf{w}) \right) \\ & \Rightarrow F(\mathbf{x}) \preceq_{(Z)} F(\mathbf{w}) \end{aligned} \quad (20)$$

which concludes the proof. \square

B SUPPLEMENTARY RESULTS

B.1 FEATURE SELECTION IN BIOINFORMATICS
