

# Supplementary Materials: SleepMG: Multimodal Generalizable Sleep Staging with Inter-modal Balance of Classification and Domain Discrimination

Anonymous Authors

## 1 MODEL ARCHITECTURE DESIGN

### 1.1 FeatureNet

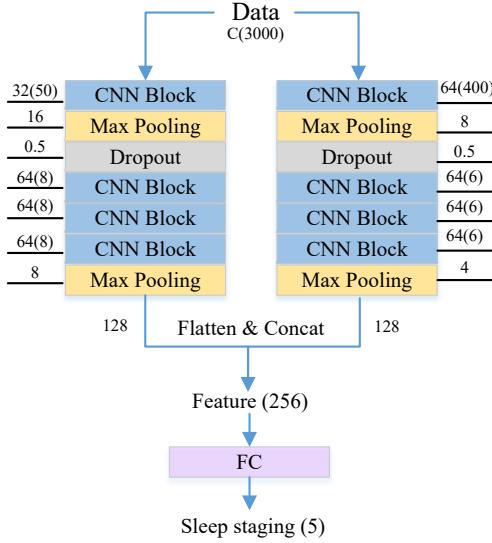

Figure 1: The model architecture of FeatureNet.

Figure 1 illustrates the model architecture of FeatureNet [2, 3], where the 'number(number)' is the 'kernel number(convolution size)' and  $C = 10$  channels if FeatureNet is a single baseline method.

### 1.2 Multimodal sleep staging with FeatureNet

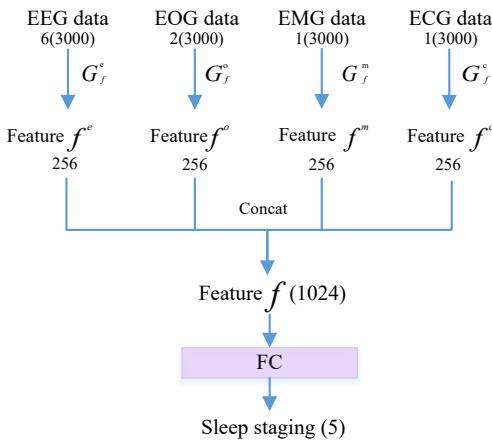

Figure 2: The model architecture of Multimodal sleep staging.

Figure 2 illustrates the model architecture of multimodal sleep staging with FeatureNet. We employ the feature extractor of FeatureNet as the modality-specific feature extractor, followed by the same concatenation and classification with a fully connected model. We add the domain discriminator [1, 3] based on the architecture of Figure 2 for NaiveMG to improve the cross-domain generalization [5].

We employ the same model architecture as NaiveMG for SleepMG. Additionally, we design modality-specific performance assessments [4] in classification and domain discrimination. Leveraging modal performance metrics, we dynamically adjust the gradient of the modality-specific parts of the classifier and domain discriminator, balancing the inter-modal differences in two aspects.

## 2 CONFUSION MATRIX

### 2.1 Baseline methods

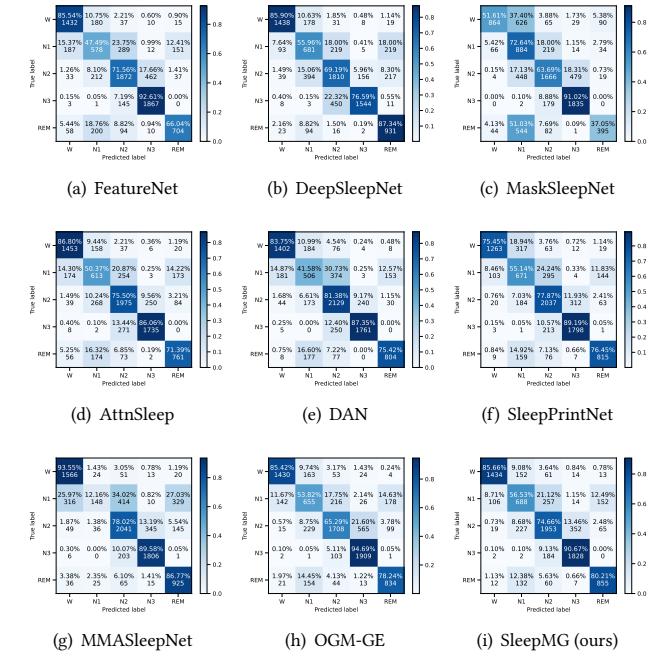

Figure 3: The confusion matrix of the baseline methods on the ISRUC-S3 dataset.

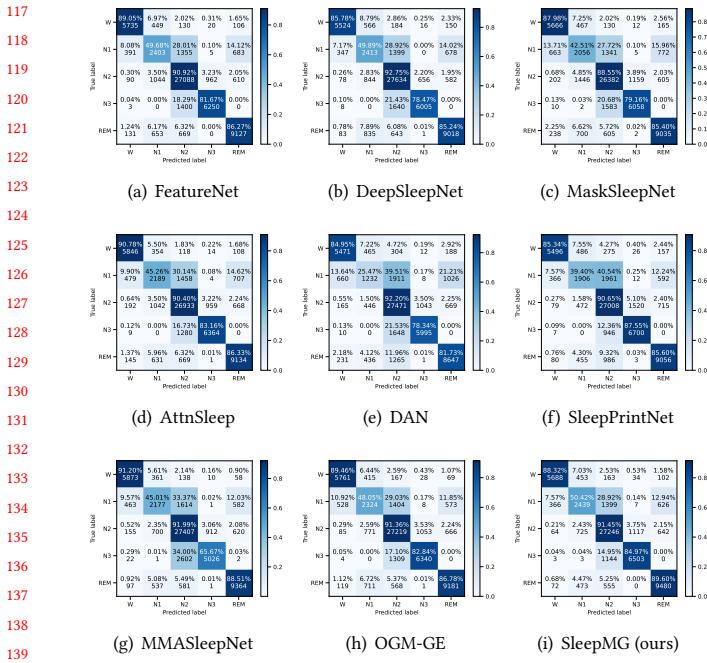

Figure 4: The confusion matrix of the baseline methods on the MASS-SS3 dataset.

## 2.2 Multimodal and Generalizable modules ablation

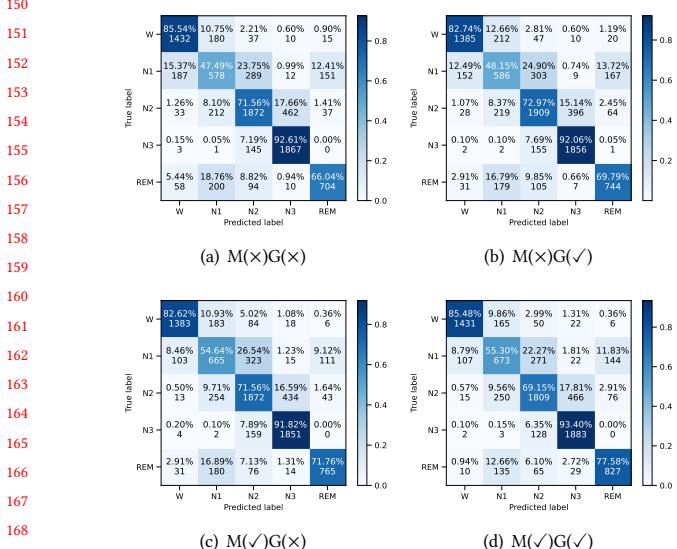

Figure 5: The confusion matrix of the M(ultimodal) and G(eneralizable) modules ablation experiments of NaiveMG(✓) on the ISRUC-S3 dataset.

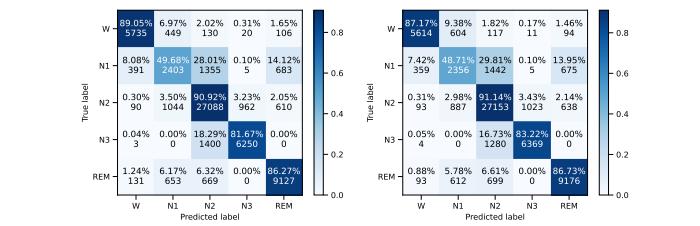

Figure 6: The confusion matrix of the M(ultimodal) and G(eneralizable) modules ablation experiments of NaiveMG(✓) on the MASS-SS3 dataset.

## 2.3 multimodal feature fusion methods ablation

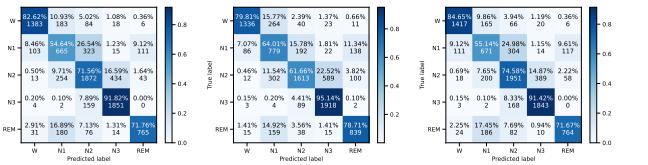

Figure 7: The confusion matrix of the multimodal feature fusion methods ablation experiments of FeatureNet on the ISRUC-S3 dataset.

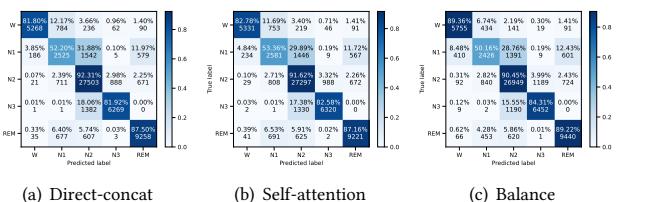

Figure 8: The confusion matrix of the multimodal feature fusion methods ablation experiments of FeatureNet on the MASS-SS3 dataset.

## 233 2.4 balancing different components ablation

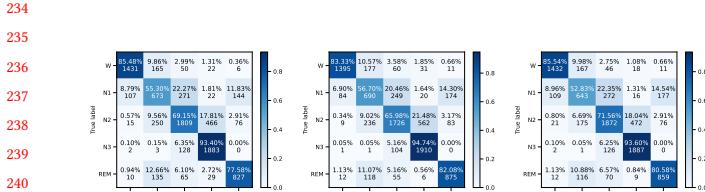

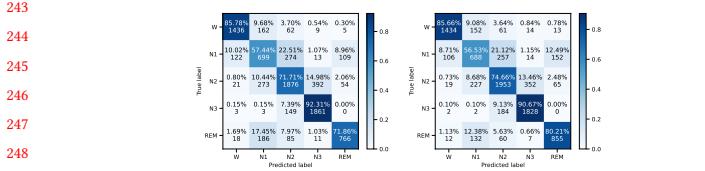

(a)  $\times \times \times$ (b)  $\checkmark \times \times$ (c)  $\times \checkmark \times$ (d)  $\times \times \checkmark$ (e)  $\times \checkmark \checkmark$ 

Figure 9: The confusion matrix of balancing different components ( $G_f^u, G_y^u, G_d^u$ ) of NaiveMG on the ISRUC-S3 dataset.

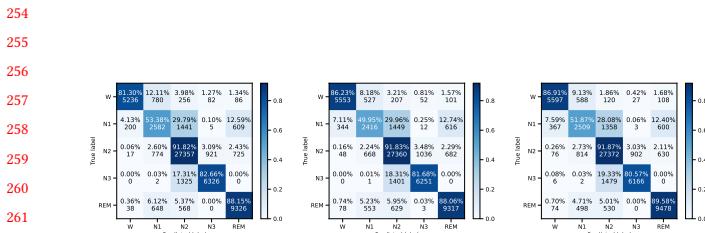

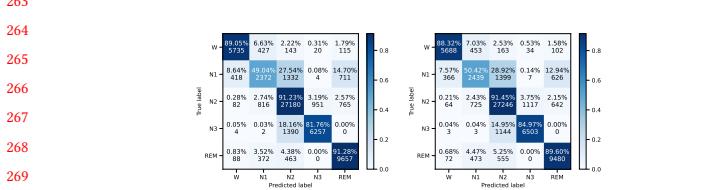

(a)  $\times \times \times$ (b)  $\checkmark \times \times$ (c)  $\times \checkmark \times$ (d)  $\times \times \checkmark$ (e)  $\times \checkmark \checkmark$ 

Figure 10: The confusion matrix of balancing different components ( $G_f^u, G_y^u, G_d^u$ ) of NaiveMG on the MASS-SS3 dataset.

(a)  $\times \times \times$ (b)  $\checkmark \times \times$ (c)  $\times \checkmark \times$ (d)  $\times \times \checkmark$ (e)  $\times \checkmark \checkmark$
