

We thank the reviewers for all their great suggestions and feedback! We have now improved the system in the following main ways: 1. Added tooltips to explain all the generation parameters (e.g., temperature/randomness, frequency penalty, etc.). Also, renamed temperature to randomness to make it more understandable. 2. Added a flag to report inappropriate analogies. We have also revised the paper to reflect these changes. Further, since we save user interactions including their feedback, we have included personalization and prompt-tuning as important future work in the paper, especially once the system gains more users.
