Code: <https://github.com/aws-labs/autogluon> 

Tutorial: https://autogluon.ai/stable/tutorials/tabular_prediction/tabular-multimodal-text-others.html

```
from autogluon.tabular import TabularPredictor
predictor = TabularPredictor(label='class').fit('train.csv', presets='best_quality', hyperparameters='multimodal')
predictions = predictor.predict('test.csv')
```

Multimodal Data (Numeric & Categorical & Text)

| name | desc | goal | country | currency | created_at | final_status |
|---|---|---------|---------|----------|------------|--------------|
| The Secret Order - The Game that gives back GI... | Can you trust your friends? Solve the puzzle? ... | 5000.0 | GB | GBP | 1424101105 | 0 |
| Booker Family Foods. Home made, the way food s... | Community based, home-made-foods producer, to ... | 2500.0 | US | USD | 1404617242 | 0 |
| J.A.E.S.A.: Next Generation Artificial Intelli... | A true next generation AI with the ability to ... | 30000.0 | CA | CAD | 1399078600 | 1 |

Table 1: Example of data in our multimodal benchmark with text (*name, desc*), numeric (*goal, created_at*), and categorical (*country, currency*) columns. From these features, we predict if a Kickstarter project will be funded (*final_status*).

Modeling Multimodal Data with Text Fields

- Fit Text Neural Network on text features (Transformer)
- Fit classical Tabular Models on numeric+categorical features (GBDT, random forest, etc.)
- Option 1: Ensemble Tabular & Text Models
- Option 2: Fit Tabular Models after featurizing text into vector form (N-gram, word2vec, or Transformer embedding)
- Option 3: Adapt Text Network to additionally operate on numeric + categorical features

Multi-Modal Transformer Network

- Handling multiple text columns

- Multi-tower Network Architecture

- Easy to fit/deploy

```
from autogluon.text import TextPredictor
predictor = TextPredictor('label').fit(train_data)
```

Table 3: Predictive performance of AutoML strategies over our multimodal benchmark. Column 'avg.' lists each method's average score (across datasets) and 'mrr' lists the mean reciprocal rank among all models evaluated in the benchmark. Each subsection encapsulates the variants compared at a design stage, with the final choice (best avg.) marked by *.

Interesting Findings

- Neural embedding of text followed by tabular modeling is often outperformed by: N-gram featurization or leveraging text neural nets for their *predictions* (stack ensembling) not *representations* (embeddings)
- In multimodal networks, fusing modalities in *early* layers (Transformers with cross-modality attention) is **not** necessarily superior to older multi-tower architectures that fuse representations in *late* layers
- End-to-end multimodal neural net is improved by *stack ensembling* this network with tabular models trained in separate stages (not end-to-end)

Multi-Modal Network: Options

Figure 1: Fusion strategies in Multimodal-Net, dense output layers on top are not shown.

Aggregating Text & Tabular Models: Options

Figure 2: Methods to combine Multimodal-Net and classical tabular models.

Tabular 1, 2, ... = Tabular Models (eg. Boosted Tree, Random Forest, etc.)
