

## A Training parameters

- Batch size: 32
- Number of levels in attention U-Net: 4
- Learning rate: 0.0001
- DDPM training timesteps: 1000
- DDPM inference timesteps: 50
- Model prediction target:  $\epsilon (\mathbf{x}_t - \mathbf{x}_0)$

Full training details are provided at:

<https://github.com/matt-baugh/img-cond-diffusion-model-ad> .

## B Anomaly map function

Table 1: Comparing detection and localisation results when using different functions to generate the anomaly map by comparing the restored image to the original. Comparing the ensemble performance ( $\text{Ours}_{ens.}$ ) and the average performance of each individual model ( $\text{Ours}_{avg.}$ ). On average Structural Similarity Index Measure (SSIM) gives marginally better results than Mean Absolute Error (MAE).
