

# 1 Checklist

- 2 1. **Claims:** Do the main claims made in the abstract and introduction accurately reflect the  
3 paper’s contributions and scope? [Yes]
- 4 2. **Code Of Ethics:** Have you read the NeurIPS Code of Ethics and ensured that your research  
5 conforms to it? [Yes]
- 6 3. **Broader Impacts:** If appropriate for the scope and focus of your paper, did you discuss  
7 potential negative societal impacts of your work? [Yes]
- 8 4. **Limitations:** Did you describe the limitations of your work? [Yes]
- 9 5. **Theory:** If you are including theoretical results, did you state the full set of assumptions of  
10 all theoretical results, and did you include complete proofs of all theoretical results? [N/A]
- 11 6. **Experiments:** If you ran experiments, did you include the code, data, and instructions  
12 needed to reproduce the main experimental results (either in the supplemental material or as  
13 a URL)? [Yes]
- 14 7. **Training Details:** If you ran experiments, did you specify all the training details (e.g., data  
15 splits, hyperparameters, how they were chosen)? [Yes]
- 16 8. **Error Bars:** If you ran experiments, did you report error bars (e.g., with respect to the  
17 random seed after running experiments multiple times), or other information about the  
18 statistical significance of your experiments? [N/A]
- 19 9. **Compute:** Did you include the amount of compute and the type of resources used (e.g.,  
20 type of GPUs, internal cluster, or cloud provider)? [Yes]
- 21 10. **Reproducibility:** If the contribution is a dataset or model, what steps did you take to make  
22 your results reproducible or verifiable? [Yes]
- 23 11. **Safeguards:** Do you have safeguards in place for responsible release of models with a high  
24 risk for misuse (e.g., pretrained language models)? [N/A]
- 25 12. **Licenses:** If you are using existing assets (e.g., code, data, models), did you cite the creators  
26 and respect the license and terms of use? [Yes]
- 27 13. **Assets:** If you are releasing new assets, did you document them and provide these details  
28 alongside the assets? [Yes]
- 29 14. **Human Subjects:** If you used crowdsourcing or conducted research with human subjects,  
30 did you include the full text of instructions given to participants and screenshots, if applicable,  
31 as well as details about compensation (if any)? [N/A]
- 32 15. **IRB Approvals:** Did you describe any potential participant risks and obtain Institutional  
33 Review Board (IRB) approvals (or an equivalent approval/review based on the requirements  
34 of your institution), if applicable? [N/A]

## 35 Appendix

36 In the supplementary material, we provide additional visualization results, limitations, potential  
 37 negative societal impacts and compute requirements of the MemSPM. In the pursuit of reproducible  
 38 research, we will make the demo and network weights of our code available to the public.

39 This supplementary is organized as follows:

- 40 • Section A: Notations
- 41 • Section B: Limitation
- 42 • Section C: Potential societal impact
- 43 • Section D: Implementation details
  - 44 ◦ Baseline details
  - 45 ◦ Compute requirements
- 46 • Section E: Visualization Results

## 47 A Notations

Table 1:

|                 | Symbol                        | Description  |
|-----------------|-------------------------------|--|
| Model           | $f_{encode}^{fixed}(\cdot)$   | Fixed image encoder  |
|                 | $f_{decode}^{unfixed}(\cdot)$ | Unfixed reconstruction decoder                             |
|                 | $f_{class}^{UniDA}$           | UniDA classifier   |
|                 | $M$                           | Memory unit  |
|                 | $W$                           | Weight vector  |
| Space           | $\mathcal{D}^s$               | Labeled source dataset                                     |
|                 | $\mathcal{D}^t$               | Unlabeled target dataset                                   |
|                 | $C$                           | Common label set   |
|                 | $C_s$                         | Source label set   |
|                 | $C_t$                         | Target label set   |
|                 | $\hat{C}_s$                   | Source private label set                                   |
|                 | $\hat{C}_t$                   | Target private label set                                   |
| Samples         | $X$                           | Input image  |
|                 | $\hat{X}$                     | Reconstruction of image                                    |
|                 | $Z$                           | Input-oriented embedding                                   |
|                 | $\hat{Z}$                     | Task-oriented embedding                                    |
|                 | $L$                           | Label of the image   |
|                 | $\hat{L}$                     | Prediction of image  |
| Measures        | $w_{i,j}$                     | Attention weight measurement between $Z$ and sub-prototype |
|                 | $d(\cdot, \cdot)$             | Cosine similarity measurement                              |
|                 | $\hat{w}_{i,j}$               | Adaptive threshold operation on $w_{i,j}$                  |
| Hyperparameters | $N$                           | Number of memory items                                     |
|                 | $S$                           | Number of sub-prototypes partitioned in each memory item   |
|                 | $D$                           | Dimension of each sub-prototype                            |
|                 | $K$                           | Top-K relevant sub-prototypes of $Z$                       |

## 48 B Limitation

49 Training memory unit of MemSPM is challenging when adopting the commonly used ResNet-50 as  
 50 the backbone. This is due to the memory unit’s composition of massive randomly initialized tensors.

51 During the early stage of training, there is a lack of discriminability in the input-oriented embedding,  
52 which leads to addressing only a few sub-prototypes. This decoupling of the memory unit from the  
53 input data necessitates using a better pre-trained model (ViT-B/16 pre-trained on CLIP) and fixing  
54 the encoder to reduce computation requirements. Additionally, the number of sub-prototypes in one  
55 memory item might need to be adjusted for the diversity of the category.

## 56 C Potential Societal Impact

57 Our finding of the intra-class concept shift may influence the future work on domain adaption or  
58 other tasks. They can optimize the construction and refinement of the feature space by considering  
59 the intra-class distinction. The MemSPM also provides a method can be used to demonstrate the  
60 interpretability of model for further deployment. However, the utilization of MemSPM method for  
61 illegal purposes may be facilitated by their increased availability to organizations or individuals.  
62 And the MemSPM method may be susceptible to adversarial attacks as all contemporary deep  
63 learning systems. Although we demonstrate increased performance and interpretability compared to  
64 the state-of-the-art methods, negative transfer is still possible in extreme cases of domain-shift or  
65 category-shift. Therefore, our technique should not be employed in critical applications or to make  
66 significant decisions without human supervision.

## 67 D Implementation details

68 **DCC.** We use ViT-B/16 [1] as the backbone. The classifier is made up of two FC layers. We use  
69 Nesterov momentum SGD to optimize the model, which has a momentum of 0.9 and a weight decay  
70 of  $5e-4$ . The learning rate decreases by a factor of  $(1 + \alpha \frac{i}{N})^{-\beta}$ , where  $i$  and  $N$  represent current  
71 and global iteration, respectively, and we set  $\alpha = 10$  and  $\beta = 0.75$ . We use a batch size of 36 and the  
72 initial learning rate is set as  $1e-4$  for Office-31, and  $1e-3$  for Office-Home and DomainNet. We use  
73 the settings detailed in [2]. PyTorch [3] is used for implementation.

74 **GLC.** We use ViT-B/16 [1] as the backbone. The SGD optimizer with a momentum of 0.9 is used  
75 during the target model adaptation phase of GLC [6]. The initial learning rate is set to  $1e-3$  for  
76 Office-Home and  $1e-4$  for both VisDA and DomainNet. The hyperparameter  $\rho$  is fixed at 0.75 and  
77  $|L|$  at 4 across all datasets, while  $\eta$  is set to 0.3 for VisDA and 1.5 for Office-Home and DomainNet,  
78 which corresponds to the settings detailed in [6]. PyTorch [3] is used for implementation.

### 79 Existing code used.

- 80 • DCC [2]: <https://github.com/Solacex/Domain-Consensus-Clustering>
- 81 • GLC [6]: <https://github.com/ispc-lab/GLC>
- 82 • PyTorch [3]: <https://pytorch.org/>

### 83 Existing datasets used.

- 84 • Office-31 [7]: <https://www.cc.gatech.edu/~ljjudy/domainadapt>
- 85 • Office-Home [8]: <https://www.hemanthdv.org/officeHomeDataset.html>
- 86 • DomainNet [4]: <http://ai.bu.edu/M3SDA>
- 87 • VisDA [5]: <http://ai.bu.edu/visda-2017/>

88 **Compute Requirements.** For our experiments, we used a local desktop machine with an Intel Core  
89 i5-12490f, a single Nvidia RTX-3090 GPU and 32GB of RAM. When we adapt the batch-size used  
90 in DCC [2], our MemSPM only occupies 4GB of GPU memory during training in result of fixing the  
91 encoder.

## 92 E Visualization

93 We provide more results of visualization in Figure 1 and Figure 2 to reveal sub-prototypes stored in the  
94 memory unit, which demonstrate that our MemSPM approach can learn the intra-class concept shift.

Figure 1: The reconstruction visualization shows what have been learned in the memory, which demonstrates the intra-class diversity have been learned by MemSPM.

Figure 2: The tSNE visualization shows the distribution of the retrieved sub-prototypes and demonstrates that the sub-classes have been learned by MemSPM.
