

Ground Truth Caption:

Radiographic exam showing an unstable fracture of the distal clavicle.

LLaMA32-Med Output:

Initial antero-posterior radiographs showing the 2-part fracture of the right clavicle.

Original LLaMA 3.2 Output:

The image is a shoulder x-ray. The shoulder and its surroundings are clearly visible and can be identified on the image, as are all the major and minor bones surrounding it. This means that there is a good quality image and it is clearly identifiable.

In this image, I see the scapula, clavicle, the head, and shaft of the humerus, all of which are well-formed. The x-ray shows a clear path from the acromion to the scapula which suggests that it may be the subacromial space. The acromio-clavicular and shoulder joint is not affected in this image.
