## UPS: Unified Projection Sharing for Lightweight Single-Image Super-resolution and Beyond

Anonymous Author(s)

### 1 Quantitative Comparison with More Methods.

In Table 1 and Table 2, we present additional lightweight SISR models for comparison. It is evident that UPS demonstrates state-of-the-art performance across various public benchmarks and settings. Furthermore, UPS-S, which is even more lightweight, achieves comparable results compared to other methods. Particularly noteworthy is the substantial performance improvement of UPS-S over our baseline model (SwinIR-S [1]), thereby validating the efficacy of our proposed unified projection-sharing strategy.

### 2 More Qualitative Results

We provide additional visual examples in Fig. 1 and Fig. 2 for several widely used benchmarks, including Set14 [19], BSD100 [20], DIV2K [21], Manga109 [22]. Compared with SOTA SISR methods, i.e., LAPAR-A [12], SwinIR-light [1], NGswin [15], UPS reconstructs clearer image textures and fewer artifacts, demonstrating its effectiveness of similarity modeling.

Table 2: Quantitative results of SOTA lightweight SISR methods ( $\times 3$ ,  $\times 4$ ).
