Are LLMs Prescient? A Continuous Evaluation using Daily News as the Oracle

Abstract

Many existing evaluation benchmarks for Large Language Models (LLMs) quickly become outdated due to the emergence of new models and training data. These benchmarks also fall short in assessing how LLM performance changes over time, as they consist of static questions without a temporal dimension. To address these limitations, we propose using future event prediction as a continuous evaluation method to assess LLMs' temporal generalization and forecasting abilities. Our benchmark, Daily Oracle, automatically generates question-answer (QA) pairs from daily news, challenging LLMs to predict "future" event outcomes. Our findings reveal that as pre-training data becomes outdated, LLM performance degrades over time. While Retrieval Augmented Generation (RAG) has the potential to enhance prediction accuracy, the performance degradation pattern persists, highlighting the need for continuous model updates.

1 Introduction

Traditional Large Language Model (LLM) benchmarks are often static, and do not reflect real-world information that evolves over time. This presents two significant challenges. First, as LLMs are updated, there is a risk that the static benchmarks become outdated and more vulnerable to data leakage, where their content might end up in the training data of newer models. This undermines the reliability of performance assessments on these benchmarks (Sainz et al., 2023; Xu et al., 2024; McIntosh et al., 2024; Li & Flanigan, 2024). Second, the static benchmarks often lack the temporal information to track the model's performance variations over time (McIntosh et al., 2024). This creates a need for evaluation methods that stay relevant over time and incorporate temporal dynamics.

Daily news provides a natural setting for continuous evaluation of LLMs. Since the world is constantly changing, a benchmark designed around forecasting the next day's news will never be out of date by construction. In addition to enabling continuous evaluation, forecasting is itself a longstanding challenge with significant implications across various domains, including healthcare, finance, and policymaking (Tetlock & Gardner, 2016; Dempsey et al., 2017; Gillingham et al., 2018; Lopez-Lira & Tang, 2023). While human experts have traditionally made such forecasts, machine learning models, particularly LLMs, have emerged as promising alternatives due to their capability to learn from vast and diverse corpora (Halawi et al., 2024; Ye et al., 2024; Yan et al., 2023). Several recent forecasting question-answer (QA) datasets have been developed (Jin et al., 2021; Zou et al., 2022; Zhang et al., 2024), however, they are limited in either size, scope, or do not continuously keep pace with the rapidly changing world. More critically, the extent to which LLMs' predictive abilities change over time remains underexplored.

In this work, we propose Daily Oracle—a continuous evaluation benchmark that uses automatically generated QA pairs from daily news to assess how the future prediction capabilities of LLMs evolve over time. The QA pairs are generated on a daily basis, consisting of True/False (TF) and Multiple Choice (MC) questions across various categories such as business, politics, and arts. Unlike traditional reading comprehension tasks, these QA pairs are designed to challenge LLMs to predict future events based on their own existing knowledge, effectively evaluating their temporal generalization and forecasting abilities.

We continuously evaluate various LLMs, both with and without access to a limited archive of news articles. Our experiments reveal that LLMs experience an average performance decline of 20.14% on True/False (TF) questions and 23.26% on Multiple Choice (MC) questions between January 2020

and September 2024, with degradation becoming more pronounced before and after the models' knowledge cutoff dates. Although models utilizing Retrieval Augmented Generation (RAG) (Lewis et al., 2020) can demonstrate improved prediction performance, the downward trend persists, suggesting an ongoing challenge in maintaining temporal generalization. Overall, our benchmark highlights the challenges posed by outdated pertaining data in LLMs, and underscores the necessity for continuous model updating to keep up with the constantly evolving stream of real-world information.

To summarize, our key contributions are two-fold:

- **Continuous Forecasting Evaluation Benchmark**: We present Daily Oracle, the largest and most up-to-date forecasting dataset, composed of automatically generated QA pairs. This benchmark continuously evaluates LLMs' temporal generalization and future prediction abilities using daily news, ensuring relevance over time and offering a challenging evaluation framework.

- **Empirical Findings on Performance Degradation**: Our experiments demonstrate a consistent decline in LLM prediction accuracy over time, even when supplemented with recent "open-book" information. The persistent degradation highlights the challenges posed by outdated pretraining data in LLMs and underscores the necessity for continuous model updating.

2 RELATED WORK

Temporal Generalization of LLMs. Lazaridou et al. (2021) define temporal generalization as the ability of Language Models to generalize well to future data from beyond their training period. They demonstrate that Transformer-XL's performance deteriorates over time, evidenced by increasing perplexity when evaluated on post-training data. However, perplexity-based metrics have two main limitations: they cannot be applied to closed-source models lacking accessible logits, and increased perplexity does not necessarily indicate degraded performance on downstream tasks (Röttger & Pierrehumbert, 2021; Agarwal & Nenkova, 2022). Zhu et al. (2024) investigate temporal generation using the Bits Per Character (BPC) metric. Similar to perplexity, BPC fails to capture higher-level performance on downstream tasks. In contrast, our work focuses on evaluating how well models acquire and utilize real-world event knowledge in downstream forecasting tasks, providing a more nuanced assessment of temporal generalization.

Dynamic QA Datasets. While static QA datasets evaluate models on fixed knowledge snapshots, dynamic QA datasets incorporate a temporal dimension, allowing assessment of how models adapt to evolving information. Several dynamic QA datasets are proposed. Chen et al. (2021) construct TimeQA by using time-sensitive facts in WikiData with aligned Wikipedia passages to synthesize QA pairs. Zhang & Choi (2021) introduce SituatedQA by manually annotating temporally and geographically dependent questions. StreamingQA (Liska et al., 2022) and RealtimeQA (Kasai et al., 2024) are both dynamic benchmarks with QA pairs answerable from news articles. StreamingQA, however, does not provide continuous evaluation with always-relevant data. RealTimeQA does not address forecasting and is more like a plugin for a search engine, in the sense that it tests whether a model has updated its knowledge as facts change, rather than testing whether it can predict what will change given its knowledge of the past. FreshQA (Vu et al., 2024) contains a fixed set of human-written open-ended questions whose answers by nature can change based on new developments in the world, but is smaller and does not address forecasting. It is also updated weekly rather than daily. While all these datasets have some form of time-sensitivity like the Daily Oracle, they either do not provide continuous evaluation or do not evaluate forecasting capabilities, or neither.

Forecasting Datasets. Forecasting questions aim to assess a model's ability to predict the outcomes of future events based on its existing knowledge. Several datasets in the event forecasting field have been introduced. ForecastQA (Jin et al., 2021) used crowdworkers to collect 10,392 QA pairs from news articles. Zou et al. (2022) argue that the QA pairs from ForecastQA are often nonsensical or ambiguous since they are written by humans without forecasting expertise. They further introduce AutoCast, a forecasting dataset from popular human forecasting tournaments containing 6,707 QA pairs. In contrast, our Daily Oracle dataset is generated automatically from daily news articles, which means that it is never out of date, can easily grow its size automatically without additional inputs from human forecasters, and provides more comprehensive event coverage than human forecasting tournaments.

Dataset	Continuous?	Interval	Forecast?	Size	Latest Update
TimeQA	✗	None	✗	20,000	2021
SituatedQA	✗	None	✗	4,757	2021
StreamingQA	✗	None	✗	36,800	2021
RealTimeQA	✗	None	✗	1,470	2023
FreshQA	✓	Weekly	✗	600	2024
ForecastQA	✗	None	✓	10,382	2019
AutoCast	✗	None	✓	6,707	2022
TLB-forecast	✗	None	✓	6,604	2022
FreshBench	✓	Unknown	✓	2,532	2024
Daily Oracle (Ours)	✓	Daily	✓	29,988	2024

Table 1: We compare Daily Oracle with existing benchmarks in the literature. For continuously updated datasets (e.g. Daily Oracle, FreshBench, and FreshQA), "Interval" refers to the dataset update interval, and "Size" and "Latest Update" refer to the fixed data currently available. Our Daily Oracle benchmark is the only forecasting benchmark which is continuously updated every day using questions generated from daily news.

Similar to our generation method, TCELongBench (Zhang et al., 2024) has an automatic forecasting QA generation framework using news articles. However, their TLB-forecast dataset is constrained both temporally and topically, and only contains cooperation and conflict events in Middle-Eastern countries from 2015 to 2022. This restricts the dataset from evaluating more general event-prediction abilities. Furthermore, considering most of the powerful LLMs have been developed after 2020, the portions of the dataset covering earlier years may contain answers already seen during training. This prior exposure compromises the dataset's effectiveness as a forecasting benchmark. In contrast, our dataset spans a broader timeframe and covers more topics, offering a more comprehensive and reliable forecasting benchmark.

Note that none of the aforementioned datasets provide insights into how prediction ability changes over time. Zhu et al. (2024) introduce FreshBench, a forecasting dataset scraped from the Good-JudgmentOpen platform, and also study temporal generalization. However, they report accuracy in a relatively short time window (from January 2023 to April 2024) with only 2,532 questions. While we observe a gradual performance decline in our dataset, they report significant fluctuations in model accuracy shortly after release. We argue that our dataset presents a more challenging task, as evidenced by the continuous degradation in model performance over time, making it a robust benchmark for assessing LLMs' temporal generalization.

In order to clearly showcase the differences between our dataset and prior work, we highlight a few key features in Table 1. The Daily Oracle is the only benchmark which is continuously updated on a daily basis and evaluates forecasting ability. Additionally, at the fixed size we use for analysis we provide significantly more evaluation examples than the other automatically updated benchmarks.

3 THE DAILY ORACLE DATASET

In this section, we present Daily Oracle, a continuously updated QA benchmark of forecasting questions that are automatically generated from daily news. For our current analysis of LLM performance, we utilize a subset of the data consisting of 16,082 TF questions and 13,906 MC questions, covering a diverse range of forecasting topics, which are generated using daily news articles from January 2020 up until September 2024. However, our QA generation framework is continuous and updates daily. In section 3.1, we describe our LLM-based dataset construction pipeline, detailing the data sources and the four-step construction process. Section 3.2 provides an analysis and general overview of the dataset.

3.1 DATASET CONSTRUCTION

Data Source. Following Zou et al. (2022), we collect a large corpus of news articles from the daily-updated Common Crawl News Dataset (Nagel, 2016) with the `news-please` package (Hamborg et al., 2017). We filter for mainstream sources—CBS News, CNBC, CNN, Forbes, and NPR. While our data collection and evaluation are performed daily, for this study we utilize a static

Figure 1: Overview of the Daily Oracle dataset. (a) The LLM-based data construction process. (b) Daily Oracle covers various MC question types. (c) Broad topic coverage of Daily Oracle.

news corpus with 1,216,925 English articles spanning January 2019 to September 2024. This corpus is also used for the constrained open-book evaluation setting in section 4.1.

LLM-based Construction Process. QA pairs are generated from articles published between January 2020 and September 2024.[1] Due to budget constraints, for each day, we select six articles for QA generation: three are chosen randomly, and three are selected from hot topics. Details for how hot topics are chosen can be found in Appendix A.1. For each selected article, we then use LLM to generate two TF QA pairs and two MC QA pairs with the few-shot prompting technique.[2]

Inspired by Zhang et al. (2024), our QA construction follows four steps, as illustrated in Figure 1(a):

(1) *Article Summary.* We generate a summary for each article, focusing on new events from the publishing date, instead of opinion articles discussing events from the past. This approach allows us to use the publication date as the resolution date of the generated question. Questions can then be regarded as valid forecasting questions since they are prior to the resolution date.

(2) *QA Generation.* After filtering out the articles that do not introduce new events, two TF questions and two MC questions are generated together with the answers per article. To ensure balance in the TF questions, we instruct the LLM to generate the first question with a "Yes" answer and the second with a "No."

(3) *Misleading Choices Generation.* For MC, we provide the article, its publishing date, and the QA pair to the LLM, which then generates three misleading choices.

(4) *QA Filtering.* In the final step, we prompt the LLM to check seven principles: correctness of answers, non-answerability before the publication date, absence of information leakage, objectivity, inclusion of a clear temporal element, public interest, and non-obviousness of the answer. Each principle is scored with 0, 1, or 2 points, and we selected the questions that received at least 13 points in total.

These principles are detailed in Appendix A.2. We use GPT-3.5 (OpenAI, 2024) for steps (1) and (4), while GPT-4 (OpenAI, 2023) is utilized for steps (2) and (3) to ensure high data quality, as GPT-4 is currently the best-performing LLM available.

---

[1]For news articles in 2019, we use them as the corpus for the constrained open-book setting.

[2]See Appendix C for all the prompts we use.

3.2 Dataset Analysis

Summary Statistics. At the time of writing this paper, the subset dataset we use from Daily Oracle consists of 16,082 TF and 13,906 MC QA pairs, covering the period from January 1st, 2020, to September 30th, 2024, with an average of 17.3 questions per day. Figure 1(b) shows that our dataset covers various MC question types, mainly starting with "What will" (26.9%), "Who will" (21.0%), and "Which ... will" (18.4%). Figure 1(c) provides a breakdown of the categories, highlighting our dataset's broad coverage. The categorization of each question is determined using GPT-3.5, based on the prompt from Halawi et al. (2024). Examples of QA pairs are shown in Table 2.

Type	Category		Question and Answer
TF		Politics & Governance	Will the prosecution's key witness in the New York hush money trial in April 2024 be someone other than Michael Cohen? –**No.**
TF		Politics & Governance	Will the House Energy and Commerce Committee vote unanimously to advance a bill that could potentially ban TikTok if ByteDance does not sell the app by March 2024? –**Yes.**
MC	What	Science & Tech	What will be the starting price range for the Google Pixel 8a as of May 2024? A.$599–$649 B. $199–$249 C. $750–$800, D. $499–$559. –**D.**
MC	Who	Sports	Who will go on the injured list before the New York Mets' game on May 29, 2024? A. Pete Alonso B. Edwin Diaz C. Jeff McNeil D. Francisco Lindor –**B.**
MC	Which	Arts & Recreation	By May 2024, on which streaming service will "The First Omen" become available for subscribers? A. Disney+, B. Hulu, C. Amazon Prime Video, D. Netflix –**B.**
MC	How many	Science & Tech	How many U.S. states will the path of totality cross during the total solar eclipse on April 8, as reported by February 2024? A. 15 B. 10 C. 20 D. 6 –**A.**
MC	Where	Healthcare & Biology	Where will the second known U.S. case of bird flu in a human be reported by March 2024? A. California, B. Texas, C. New York, D. Florida –**B.**
MC	How much	Economics & Business	How much will Apple, Inc. (AAPL) be up year-to-date by the end of June 2024? A. Up 149.5% B. Just over 19% C. 9.7%. D. 27%. –**C.**

Table 2: Daily Oracle Example Questions and Answers.

Past and Future Information Usage. Each question in Daily Oracle implicitly requires the model to retrieve relevant knowledge. How do these requirements change day by day over the course of our benchmark? Anderson & Schooler (1991) study a similar relationship in human information environments, specifically in *New York Times* headlines, children's verbal interactions, and emails. In Figure 2, we take inspiration from their work and analyze whether a word's frequency of occurrence in the past 100 days predicts its occurrence on the next day. In other words, if over the past 100 days we have frequently required the model to retrieve specific knowledge, e.g. if there are many questions about the unemployment rate, is it likely it will have to retrieve this knowledge in the future?

We analyze this relationship for words in the titles of the articles we use to generate questions as well as in the text of the TF and MC questions themselves. Past frequency is computed by checking, for each day in the 100 day window, if a word has occurred in any article title (so, the maximum frequency is 100). We find that there is a linear relationship between the frequency of usage in the past 100 days and the probability of occurrence on the 101st day in all cases, replicating Anderson & Schooler's findings for *New York Times* headlines. Interestingly, there is a drop in probability for both TF and MC questions for words with a frequency of 40, though it is unclear why. There is also some clustering at lower frequencies, particularly in the TF and MC question plots. Many words appear less than 20 times during the 100 day window. The temporal structure exhibited in the daily news stream may be of a future point of interest from a modeling perspective.

Figure 2: Following Anderson & Schooler (1991), we plot the probability of a word occurring in an **(left)** article title, **(middle)** True/False question, or **(right)** Multiple Choice question given how frequently it had appeared in one over the past 100 days, computed over our entire dataset. We fit a linear regression in each case and show a linear relationship in each case ($R^2 = 0.978, 0.986$, and 0.985 for left, middle, and right respectively).

4 EXPERIMENTS

4.1 EXPERIMENTAL SETUP

Closed-Book Setting. We evaluate various LLMs on Daily Oracle to assess their understanding of real-world events and temporal generalization abilities, i.e., how accurately LLMs can answer forecasting questions based on the knowledge they learned from their training data. Our evaluation differentiates between two scenarios based on the question's resolution date and model's knowledge cutoff date: (1) *Pre-Knowledge Cutoff Questions:* These questions have resolution dates before the model's knowledge cutoff, testing the model's understanding of past events. (2) *Post-Knowledge Cutoff Questions:* These have resolution dates after the knowledge cutoff, requiring models to predict future events and test their forecasting and temporal generalization abilities.

Constrained Open-Book Setting. In addition to a closed-book evaluation, we explore the constrained open-book setting: how access to news articles up to different time cutoffs influences LLM performance using RAG (Lewis et al., 2020). We introduce the concept of the RAG cutoff (*R-Cutoff*), which limits the latest accessible date for retrieving articles. To prevent the models from leveraging information beyond the resolution date, for any question with a resolution date (d_{res}), the accessible articles span from January 1st, 2019 (the start of our news corpus) up to whichever comes first between the day before the resolution date and the RAG cutoff date ($d_{\text{R-Cutoff}}$). Formally, the accessible date range is $[01/01/2019, \min(d_{\text{res}} - 1, d_{\text{R-Cutoff}}))$. Following prior work (Jin et al., 2021; Zou et al., 2022; Zhang et al., 2024), we employ BM25 (Robertson et al., 1995) as the retriever and select the top 5 articles relevant to each question. We truncate each retrieved article to a maximum length of 512 words. These articles are then incorporated into the input prompts to serve as additional information.

Gold Article Setting. We further include a setting where models are provided direct access to the gold article, from which the question is generated. This transforms the forecasting questions into reading comprehension ones, which can also access LLMs' general question-answering capabilities. Achieving high accuracy here ensures that the questions from our Daily Oracle dataset are answerable.

Metrics. Accuracy score is used as the evaluation metric. Though LLMs are tested daily, to show clearer trends, we plot the monthly performance in Figure 3, and apply a 5-month moving average to smooth the curve. We also report yearly averages and average year-over-year (YoY) accuracy change before and after models' knowledge cutoff dates in Table 3. Additionally, despite prompting the models to avoid responses like "I cannot predict the future" and instead provide definitive answers, there are cases where such refusals still occur. The rejection rates are provided in the Appendix B.2, and these cases are counted as incorrect to ensure comparability across model results.

4.2 MAIN RESULTS

Results for the Closed-Book Setting. Figure 3 and Table 3 present our primary results for the closed-book setting. The "Avg" column in Table 3 shows the average YoY accuracy change of all

months, revealing a clear degradation in performance over time across all models on both TF and MC questions. When comparing accuracies from the beginning to the end of the evaluation period, we observe that, on average, the models' performance declines by 20.14% on TF questions (from 64.68% to 51.65%) and by 23.26% on MC questions (from 58.30% to 44.74%). This indicates that while LLMs demonstrate certain abilities to understand real-world events and make predictions, they struggle to maintain these abilities.

Figure 3: Results for the closed-book setting. We plot the 5-month moving average accuracy for True/False (TF) and Multiple Choice (MC) questions across different LLMs.

Notably, the average YoY accuracy declines provide further insight. Before the knowledge cutoff, the average YoY decline across all models was relatively moderate. However, post-knowledge cutoff, we observe steeper declines in many models, with GPT-4 showing the most drastic drop in MC performance, declining by 18.47%, compared to just 4.23% before the cutoff. This contrast highlights that while LLMs manage to retain a baseline of past knowledge with small degradation, their ability to forecast future events deteriorates much more rapidly as they move beyond their training data, struggling with temporal generalization.

Among different models, Claude-3.5-Sonnet (Anthropic, 2024) significantly outperforms all others, while GPT-4 excels in MC questions but its performance in TF is not as remarkable as in MC. GPT-3.5, Qwen-2-7B (Yang et al., 2024) and Llama-3-8B (Dubey et al., 2024) show smaller temporal declines than GPT-4 in both TF and MC questions. Interestingly, Mistral-7B (Jiang et al., 2023) and Mixtral-8x7B (Jiang et al., 2024) show the most pronounced drops in TF accuracy, with scores falling below the random baseline 50% due to increased answer refusals, as shown in the Appendix B.2. Gemma-2-2B (Team et al., 2024) exhibits the most consistent performance with the smallest average YoY decline, likely due to its more recent knowledge cutoff date.

Results for the Constrained Open-Book Setting. In Figure 4, we present the results of the constrained open-book setting, with Mixtral-8x7B on TF questions and Llama-3-8B on MC questions across different RAG cutoff dates.[3] For Mixtral-8x7B, as the RAG cutoff dates extend to closer to the resolution dates, we observe a clear improvement in performance, indicating the model benefits from increasingly updated information retrieval. However, there are noticeable performance drops immediately after each RAG cutoff date when compared to providing information up to the day before the resolution date (with the exception of the March 2024 cutoff). This highlights the importance of keeping up-to-date information for optimal RAG performance. Interestingly, RAG does not uniformly enhance performance. Llama-3-8B may perform worse than the closed-book setting when the RAG cutoff is prior to the knowledge cutoff dates, suggesting outdated information may negatively impact performance. Conversely, for more recent RAG cutoff dates that extend beyond the knowledge cutoff, significant performance improvements are observed (as illustrated by the curves with cutoffs in September 2023 and March 2024). Notably, across all different RAG cutoffs, the overall performance decline pattern persists, likely due to outdated internal representations and the model's inherent knowledge limitations.

---

[3]Refer to Appendix B.4 for results of other models in the constrained open-book setting.

Table 3: For various LLMs with different knowledge cutoffs (K-Cutoffs), we show the yearly average accuracy (calculated as the average across months) from 2020 to 2024, along with the average year-over-year (YoY) accuracy change (%) before the knowledge cutoff date (Pre-Cutoff), after the knowledge cutoff date (Post-Cutoff), and the overall average YoY accuracy change across all months (Avg) on the Daily Oracle dataset.

	LLM	K-Cutoff	Average Yearly Accuracy (%)					Average YoY Accuracy Change (%)		
			2020	2021	2022	2023	2024	Pre-Cutoff	Post-Cutoff	Avg
TF	Claude-3.5-Sonnet	Apr 2024	81.21	79.88	78.05	74.38	66.25	-4.77	-11.97	-4.47

Figure 4: Results for the constrained open-book setting, evaluating Mixtral-8x7B on TF questions and Llama-3-8B on MC questions with different RAG cutoff dates.

Results for the Gold Article Setting. Figure 5 shows that when given access to the gold articles from which the questions are generated, LLM performance can be improved significantly to around 90%, demonstrating the answerability of Daily Oracle.[4] However, most of the models still show declining trends. This is noteworthy because, ideally, LLMs are expected to achieve consistent accuracy regardless of the article's publication date when answers are directly accessible. However, the outdated representations hinder their ability to consistently generate correct answers, even in a reading comprehension setting.

4.3 DISCUSSION

LLMs' Performance Evolution Across Time. We observe several LLMs' performance evolution patterns in Figure 3: (1) *Gradual Decline in the Recent Past:* In the months before the knowledge cutoff date, which we call the *recent past*, we observe a gradual decline in model performance, as seen in Llama-3-8B, GPT-4, and Claude-3.5-Sonnet, likely due to a lack of representation of recent news in the training data. (2) *Rapid Decline in the Near Future:* In the *near future*, which we define as the months following a model's knowledge cutoff date, sharp performance drops are observed in several models in MC questions. For instance, the decline in Claude-3.5-Sonnet and

---

[4]Results for GPT-3.5 are provided and discussed in Appendix B.3, as this older model performs relatively poorly and including it on the same scale would obscure the trends of other models.

Figure 5: Results for the Gold Article Setting. Most of the models struggle with temporal generalization, even when provided with gold articles containing the answers.

GPT-4 accelerates soon after their knowledge cutoffs. Most of the models, however, do not lose all the predictive power at once, as evidenced by the further decline into the farther future.

We explore this further by analyzing the slope of accuracy as a function of time. In Figure 6, we show how the slope changes as we fit a regression to an increasingly larger window of data, until we reach the full set of accuracies. Specifically, using the 5-month moving average of each model's accuracy on MC questions (visualized in Figure 3), we start by fitting a linear regression line on the first 10 months of data. We then add an additional month and compute a new regression on the larger window, repeating until we reach the final month, and applying an exponential decay weighting to past data to reduce the influence of distant observations. With this, we can analyze how the slope of our regression line changes as each month is added to the data. The slope in each case is negative after the cutoff data and for Claude-3.5-Sonnet, GPT-4, and Llama-3-8B, the slope eventually or immediately becomes more negative than it was at any point preceding the cutoff. Both Claude-3.5-Sonnet and Llama-3-8B have a crossover from positive to negative slope in late summer 2022, July and August, respectively, while GPT-4's seems to occur slightly earlier, in March of 2022. For GPT-3.5, GPT-4, and Llama-3-8B, the slope becomes increasingly negative not long after the knowledge cutoff, giving evidence for a rapid decline in the *near future*. Likewise, the period preceding the cutoff shows a less negative slope and in some cases, most obviously in the case of GPT-3.5 and Llama-3-8B, a slightly negative but consistent slope, in other words, a gradual decline in the *recent past*.

Need for Continuous Pretraining. The overall decline trend may come from two sources, the missing knowledge of future and a lack of up-to-date language representation. While the lack of knowledge can be partially recovered with information retrieval as shown in the constrained open-book setting, the gold article setting provides an "upper bound" of open-book retrieval. When provided the gold articles, the remaining decline in the model's performance suggests continuous pre-training of LLMs (Jang et al., 2022; Jin et al., 2022; Ke et al., 2022a;b; Yıldız et al., 2024) is still needed in the context of news event forecasting to address outdated representations.

TF & MC Comparison. All models except for Claude-3.5-Sonnet struggle with TF questions, where the degradation trends towards the random baseline accuracy of 50%, indicating that predicting if a future event will happen or not can be sometimes challenging for LLMs. In contrast, on MC questions, models tend to perform much better than the random baseline at 25%. There are two potential reasons that can explain the disparity. First, TF questions can be considered more open-ended than MC because the "No" answer contains other possible open-ended outcomes. Second, since the distractor choices are created by an LLM, they may not be as likely to happen as the true answer.

Consistent Performance Decline After September 2021. Interestingly, Figure 3 reveals a higher rate of performance decline around September 2021, which is the knowledge cutoff date of GPT-3.5, across all models, particularly for MC questions. In contrast, performance remains relatively stable prior to this date. We hypothesize that this trend arises because the period up to September 2021 may be overrepresented in many pretraining corpora (Raffel et al., 2020; Gao et al., 2020; Kobayashi, 2018; Gokaslan & Cohen, 2019; Zhu, 2015; Rae et al., 2019; Tiedemann, 2016; Saxton et al., 2019), compared to more recent periods. Another potential cause of this imbalance is an

(a) Claude-3.5-Sonnet   (b) GPT-4

(c) Llama-3-8B   (d) GPT-3.5

Figure 6: Coefficients for regressing accuracy on the MC questions against time, as the number of months grows. Using an initial window of 10 months, we progressively add data for additional months to our regression and plot the coefficient (slope) for the regression of accuracy against time. For our regression, we use the moving average of accuracy and apply exponentially decaying weights to older months (i.e. given a window of k months, we weight x_t with λ^{k-t}; in this case $\lambda = 0.995$). In each case, the slope becomes more negative following the knowledge cutoff period compared to the months immediately preceding it.

increasing number of websites restricting access to web crawlers (Longpre et al., 2024) after the rise of ChatGPT.

Limitations. On the data generation side, the generated questions as well as the distractor answers could contain biases from an outdated LLM, making the benchmark less reliable in the long run unless we upgrade the models. Additionally, generating questions from news articles can introduce bias by focusing only on events that have definitively occurred or not occurred. This approach overlooks speculative events, which may be of interest in forecasting questions but may not be covered in news articles, limiting the scope of the dataset. On the evaluation side, our paper proposes the continuous evaluation benchmark but at the time of the writing there isn't a long enough time horizon on each model, especially after the cutoff dates, for a thorough analysis. Ideally, we would like to analyze the relation between the effect of knowledge and RAG cutoff dates but the trend seems to be weak within the time horizon available.

5 CONCLUSION AND FUTURE WORK

We introduce Daily Oracle, a continuously updated QA benchmark leveraging daily news to evaluate the temporal generalization and future prediction capabilities of LLMs. Our experiments reveal that while LLMs maintain a degree of predictive power over future events, their prediction accuracy exhibits a gradual decline over time across various models. Notably, while the stronger model Claude-3.5-Sonnet outperforms others significantly, it still exhibits around 12% performance drop in its post-knowledge cutoff period. Although RAG mitigates the effect of outdated knowledge, a noticeable decline in performance remains. Our findings underscore the necessity for ongoing model updates with more current information and emphasize the importance of disentangling missing knowledge from the lack of up-to-date representations.

We hope this work will draw attention to the need for more practical applications of the continuous training of LLMs, driving advancements in adapting models to real-time data changes. In the future, alongside maintaining Daily Oracle, we plan to incorporate a broader range of models and explore how continuous pre-training and efficient adaptation can address the performance degradation challenges presented in our work.

APPENDIX

A DATASET DETAILS

A.1 DETAILS FOR ARTICLE SELECTION

We select daily articles that generate the QA pairs in two ways: (1) *Random Selection:* We randomly sample three articles each day. (2) *Hot Topic Selection:* To better capture daily events and reduce noise, we select three articles from the top three hot topics of the day. We identify these hot topics by applying the density-based clustering algorithm DBSCAN (Ester et al., 1996) to the new articles based on TF-IDF (Term Frequency-Inverse Document Frequency) representations, forming clusters of news articles for each day. We filter out chaotic clusters by removing those with low average in-cluster cosine similarity scores, which typically correspond to clusters containing a large number of diverse articles. The top three clusters, determined by size, are assumed to represent the most discussed events, i.e. hot topics, since larger clusters indicate more articles covering the same event. One article is picked randomly from each of the top three clusters.

A.2 QA FILTERING PRINCIPLES

Seven principles of *QA Filtering* step in the data construction process: (1) *Correctness of Answers:* The answer must be factually accurate and fully aligned with the information in the given article. (2) *Non-answerability Before the Publication Date:* Since we treat the article's publication date as the question's resolution date, the question should not be definitively answerable based on information available before the article's publication. (3) *Absence of Information Leakage:* Questions must avoid revealing information that became known only after the article's publication, maintaining fairness for pre-publication evaluation. (4) *Objectivity:* Both questions and answers must rely on objective facts, avoiding subjective ideas from the authors. (5) *Inclusion of a Clear Temporal Element:* Questions must contain a specific and clear reference to time, avoiding vague phrases like "in the future" or "soon." (6) *Public Interest:* The questions should address topics of broad public concern. (7) *Non-obviousness of the Answer:* The answer should not be immediately predictable from the question and must provide new or non-trivial insights.

A.3 QA FILTERING RESULTS

We generate a total of 37,775 QA pairs, of which 29,988 (79.39%) pass our *QA Filtering* step. This filtering process retains pairs having at most a one-point deduction, i.e. a minimum total score of 13 points. The score distribution for each principle during the *QA Filtering* step is illustrated in Figure 7. Additionally, the average scores across the seven principles in the final dataset are presented in Figure 8.

Figure 7: Scores distribution across 7 principles in the *QA Filtering* step.

Figure 8: Average scores for the seven principles in our final dataset.

B   EXPERIMENT DETAILS

B.1   BASELINE MODELS INFORMATION

Table 4 lists the LLM model versions used in our experiments.

Table 4: Baseline Model Versions.

Model	Model Version
Claude-3.5-Sonnet	claude-3-5-sonnet-20240620
GPT-4	gpt-4-1106-preview
GPT-3.5	gpt-3.5-turbo-0125
Mixtral-8x7B	Mixtral-8x7B-Instruct-v0.1
Mistral-7B	Mistral-7B-Instruct-v0.3
Llama-3-8B	Meta-Llama-3-8B-Instruct
Qwen-2-7B	Qwen2-7B-Instruct
Gemma-2-2B	gemma-2-2b-it

B.2   REJECTION RATES IN THE CLOSED-BOOK SETTING

Figure 9 shows the rejection rates for the closed-book setting. We can see that the rejection rate increases throughout the time for Mistral-7B in TF questions and Mixtral-8x7B in both TF and MC questions. This high rejection rate in TF questions for these two models results in closed-book performance dropping below the random baseline of 50% in certain months, as shown in Figure 3.

B.3   RESULTS FOR GPT-3.5 IN THE GOLD ARTICLE SETTING

To more effectively illustrate the trends of other models at a suitable scale, we display GPT-3.5's performance in the gold article setting separately. As shown in Figure 10, this outdated model performs relatively poorly throughout. While its accuracy could improve with chain-of-thought prompting (Wei et al., 2022), we report its performance using the same prompt format as the other models for consistency in comparison. Nevertheless, a clear downward trend is observed in MC questions.

B.4   MORE RESULTS IN THE CONSTRAINT OPEN-BOOK SETTING

Figures 11, 12, 13, 14, 15, 16, and 17 show the constrained open-book evaluation results for more models. Similar patterns are observed as discussed in Section 4.2. Specifically, for Claude-3.5-Sonnet, the constrained open-book performance lags behind its closed-book performance, likely

Figure 9: Rejection rates for the closed-book setting. We plot the 5-month moving average rejection rates for True/False (TF) and Multiple Choice (MC) questions across different LLMs.

Figure 10: Results for GPT-3.5 in the Gold Article Setting. Compared to other models achieving around 0.9 accuracy, GPT-3.5 performs worse in both MC questions and, more notably, in TF questions.

because it already has robust representations of world events, making RAG less effective. Additionally, GPT-3.5 is not included in the constrained open-book setting due to its unexpectedly poor performance in the gold article setting (Figure 10) and budget limitations.

Figure 11: Results for Claude-3.5-Sonnet in the constrained open-book setting.

Figure 12: Results for GPT-4 in the constrained open-book setting.

Figure 13: Results for Mixtral-8x7B in the constrained open-book setting.

Figure 14: Results for Mistral-7B in the constrained open-book setting.

B.5 AN EXAMPLE OF EVALUATING LLM UNDER DIFFERENT SETTINGS

Figure 18 presents a case study demonstrating how Mixtral-8x7B responds to a question under different experimental settings. The model provides an incorrect answer in the closed-book setting. However, when supplemented with retrieved relevant articles or the gold article, it produces the correct answer.

C PROMPTS

All the prompts we use are shown in this section. The QA generation prompts and evaluation prompts are adapted from Zhang et al. (2024), and the prompt to categorize our generated questions is taken from Halawi et al. (2024).

Figure 15: Results for Llama-3-8B in the constrained open-book setting.

Figure 16: Results for Qwen-2-7B in the constrained open-book setting.

Figure 17: Results for Gemma-2-2B in the constrained open-book setting.

[News Article]
Title: DFL leaders, Minneapolis announce deal on rideshare pay, but Lyft and Uber say they will leave
Publishing Date: 2024-05-06
Text: ST. PAUL, Minn. — Key lawmakers and DFL legislative leaders on Monday announced that they have a compromise on statewide rideshare regulations in Minnesota, but Uber and Lyft quickly rejected the plan and said that they will still exit the market if the proposal becomes law.

The amendment, which will be heard in a House committee Tuesday, includes a minimum wage pay rate of $1.27 per mile and 49 cents per minute. Leaders said they worked with the Minneapolis City Council on finding compromise, but the companies were not included in the negotiations.

The proposal is lower than the Minneapolis rate of $1.40 per mile and $0.49 per minute, but higher than study done by the Minnesota Department of Labor and Industry, which determined $0.89 mile and $0.49 for the Twin Cities metro would bring driver pay up to the city's minimum wage of $15.57 an hour.

"This was a really big move for the Minneapolis City Council. This is coming down 13 cents from the rate that they passed. And this is consistent with the rates that Uber and Lyft are operating with and other states and other jurisdictions," House Majority Leader Jamie Long, DFL-Minneapolis, who was a key negotiator, told reporters. "We know that the companies have said the same thing in other states. They've said that they were going to leave at certain rates, and they've stayed and been able to operate profitably."

Uber and Lyft quickly responded that they will still plan to leave Minneapolis — as they said would happen on July 1, when the city's ordinance is effective — and the state if this becomes law.
...

[Generated QA Pairs]
Question: What will be the response from Uber and Lyft if the proposed rideshare regulations become law in Minnesota by May 2024?
Answer: (a) They will plan to leave the market.
Misleading Choices:
(b) They will stay and adjust their pricing to meet regulations.
(c) They will collaborate to develop an alternative service model
(d) They will reduce their services rather than exit.

[Closed-Book Setting]

- The question is asked directly to Mixtral-8x7B.

- Model response: (wrong) "(d) They will reduce their services rather than exit. This is because leaving the market entirely can be a drastic move and may not be the first response to new regulations. Reducing services is a more likely response, as it allows rideshare companies to comply with the new laws while still maintaining a presence in the market. Additionally, they may also try to negotiate or influence the regulations before they become law."

[Constraint-Open Book Setting]

- The RAG-cutoff refers to the latest accessible date for retrieving articles. With RAG-cutoff = 2024-03-01, we extracted the top 5 relevant articles (here, only the titles are displayed, but the articles are included in the evaluation prompt):

    - (2023-05-25) Uber Threatens To Cut Most Service In Minnesota If Minimum Pay Law Takes Effect
    - (2023-05-25) Minnesota Governor Vetoes Rideshare Minimum Pay Bill After Uber Threatens To Leave State
    - (2023-08-09) Minneapolis City Council moving towards minimum wage for rideshare drivers
    - (2024-02-27) Minneapolis City Council to consider rideshare minimum wage ordinance Tuesday
    - (2024-01-11) Some Lyft, Uber drivers to strike Thursday at MSP Airport

- Model response: (correct) "(a) They will plan to leave the market."

[Gold Article Setting]

- In the gold article setting, models are provided direct access to the gold article, from which the question is generated. The question then is treated as a reading comprehensive question rather than a forecasting question.

- Model response: (correct) "(a) They will plan to leave the market."

Figure 18: An example of evaluating Mixtral-8x7B across different settings.

You are an expert in extracting summary and keypoint from articles.

Rules
1. Provide a comprehensive summary of the entire article in one paragraph, ensuring that all essential aspects are addressed. Your summary should include key statistics, notable dates, and any significant statements to fully convey the context and content of the news story.
2. Please provide one keypoint that summarizes the new event from the article with the following rules:
- Focus specifically on events that are newly occurring on the publication date of the article. If the article does not introduce a new event but instead discusses ongoing topics or is about non-news content like advertisements, state 'No new event reported.'
- The point should be concise, accurate and complete, especially for numbers, names and dates.
- Basically NO "he, she, they, it, them, etc" are allowed. Please clearly write out the entity you are referencing in the point.
- You are not allowed to start with any of the phrases: the article discusses, the article shows, the article emphasizes, the article discusses, the speaker says, the speaker discusses, the author mentions, etc.

Examples
Here are several examples of extracting keypoints from articles. Note that the articles in different examples are irrelevant.
Example 1:
Article: Professional golfer Lexi Thompson has announced her retirement from professional golf at the end of the 2024 season at the age of 29. Thompson, an 11-time LPGA Tour champion, made the announcement ahead of her 18th consecutive US Women's Open appearance. She turned professional in 2010 and won her first major at the 2014 Kraft Nabisco Championship. Despite enduring injuries that led to a drop in her world ranking, Thompson continued to compete at a high level. In her retirement announcement, Thompson expressed gratitude for the opportunities golf provided her and highlighted her excitement for the next chapter of her life.
Publishing Date: 2024-05-29, Wednesday
Keypoint: Lexi Thompson announced her retirement from professional golf at the end of the 2024 season at the age of 29.

Example 2:
Article: India's capital territory of Delhi sweltered to its highest-ever temperature of 49.9 degrees Celsius (121.8 degrees Fahrenheit) on Tuesday, as an oppressive heat wave forced authorities to impose water rationing.

The Indian Meteorological Department (IMD) said the new record was measured in the suburb of Mungeshpur, surpassing Delhi's previous high of 49.2 degrees Celsius (120.5 degrees Fahrenheit), observed in May 2022.
Publishing Date: 2024-05-29, Wednesday
Keypoint: Delhi experienced its highest-ever temperature of 49.9 degrees Celsius on 2024-05-28, Tuesday.

New Article
Based on the provided rules and examples, please summarize the article and identify one key point that concludes the new event on the publishing date.
Article: {}
Publishing Date: {}

Output: Output should follow the format of
Summary:
Keypoint:

Figure 19: Prompt in the *Article Summary* step, adapted from Zhang et al. (2024).

[Setup:] Today is {}. You will be testing people who are from the past, i.e. a week or a month ago. A recently published article will serve as the basis for your questioning. Your objective is to ask them questions that assess the accuracy and plausibility of their predictions about events.

You will write question-answer pairs:
1. The question should challenge the person to predict an outcome or development related to the article's content as if they were being asked one week or one month ago. Please provide the question that can be answered on {}, but only guessable not answerable before {}.
2. The answer MUST be based on factual information from the article. Ensure that the answers do not predict outcomes that have not been explicitly stated in the article.

[Rules:]
Article: {}.
Publishing date: {}

Please generate four questions about the above article, along with answers. You should follow the instructions below:
1. Please turn the key point "{}" into the question, with focusing more on whether the event will happen.
2. The question should NOT be designed for reading comprehension. Please focus more on what happened rather than the implications after the event.
3. The question MUST be in future tense.
- Start the first question with "Will", with the answer as "Yes".
- Start the second question with "Will", with the answer as "No".
- Start the third and fourth questions with a phrase like "What will", "Who will", "Where will", "Which xxx will", "How much will", or "How many will".
4. There must be a time element in the question. It can be phrases like "In {} ...", "By {}, ...", "... in {}?".
5. You MUST NOT use unclear implicit time element phrases like "in the future" or "in the upcoming weeks".
6. You should avoid: questions that require numerical reasoning; questions that require substantial world knowledge.
7. The answer MUST be short and concise, avoiding using redundant words or repeating the information in the question.
8. The question must be grammatically correct and contain the information required to answer. NO "he, she, they, it, them, etc" allowed. Please clearly write out the entity you are referencing in the question.
9. The question MUST be able to be answered by the article.
10. The question MUST NOT include the information that came out just now. It should be understandable to people from the past. Avoid using "How will" or "Why will" questions, as they imply that the event has already occurred.

[Suggested questions and questions to avoid are detailed below:]

- Keypoint: Delhi experienced its highest-ever temperature of 49.9 degrees Celsius on Tuesday, leading to water rationing due to the oppressive heat wave.
- Suggested Question: Will Delhi break the highest temperature record again by May 2024?
- Avoid This Question: Will extreme heat events continue to pose a threat to India's development in the upcoming years?
- Reason to Avoid: The time constraint "in the upcoming years" is vague and the question can not be answered based on today's knowledge.

Figure 20: Prompt in the *QA Generation* step (part 1), adapted from Zhang et al. (2024).

- Keypoint: Owners of nearly 84,000 older Nissan vehicles in the United States equipped with recalled, unrepaired Takata air bags, including models such as the 2002-2006 Nissan Sentra, are advised by NHTSA to immediately stop driving them due to safety concerns.
- Suggested Question: Will the older Nissan vehicles such as the 2002-2006 Nissan Sentra exhibit quality issues by May 2024?
- Avoid This Question: Will owners of the 2002-2006 Nissan Sentra, 2002-2004 Nissan Pathfinder, and 2002-2003 Infiniti QX4 heed the NHTSA's advice to immediately stop driving their vehicles in late May 2024?
- Reason to Avoid: This question is overly specific. People from the past would not have known the "NHTSA's advice".

- Keypoint: Children's sketches of violent scenes, likely made by children aged 5-7 before the eruption of Mt. Vesuvius in 79 AD, have been uncovered at the archaeological park of Pompeii.
- Suggested Question: Will children's sketches of violent scenes be discovered at the archaeological park of Pompeii by May 2024?
- Avoid This Question: Will the newly discovered children's sketches at the archaeological park of Pompeii be available for public viewing by May 2024?
- Reason to Avoid: This question includes future events about newly discovered children's sketches in Pompeii, which wouldn't be known to a past audience.

- Keypoint: North Korea has been sending "filth and garbage" across the border to South Korea using giant balloons as a new strategy, prompting South Korean authorities to warn of the objects landing in residential areas. The move, according to North Korean state media KCNA, was to retaliate against South Korean activists who often send materials to the North.
- Suggested Question: What will North Korea do to retaliate against South Korean activists who often send materials to the North by May 2024?
- Avoid This Question: Will North Korea continue using balloons to send items across the border to South Korea by May 2024?
- Reason to Avoid: The word "continue" should not be used here. The question MUST NOT include the information that came out just now.

[Output:] Now please write four clear and concise question-answer pairs following the instructions and examples above. Once again the question should NOT be designed for reading comprehension but of forecasting interests. Also, vague and implicit time elements like "in the future", "in the upcoming weeks" or "in the coming years" should NOT be used. The question should be able to answer on {}, but only guessable not answerable before {}. You should output the question along with its answer, in the format of
'"
Question 1: "Will xxx?"
Answer 1: Yes.

Question 2: "Will xxx?"
Answer 2: No.

Question 3: Either "What will xxx?", "Who will xxx?", "'Where will xxx?", "Which xxx will", "How much will xxx?", or "How many will xxx?"
Answer 3: xxx.

Question 4: Either "What will xxx?", "Who will xxx?", "Where will xxx?", "Which xxx will", "How much will xxx?", or "How many will xxx?"
Answer 4: xxx.
'"

Figure 21: Prompt in the *QA Generation* step (part 2), adapted from Zhang et al. (2024).

Rules
Article: {}
Given the article, please generate three noising answers to the given questions, whose correct answers can be obtained from the article. Name the three noising answers as (b), (c) and (d) respectively. While (b), (c) and (d) should all be unambiguously incorrect, they should also make sense and be plausible.

Examples
Here are examples showing the output format. This example is NOT related to the noising answers you will generate.

Question: What will be the annual change in the UK's Consumer Prices Index (CPI) for November 2021?
Correct Answer: 'Less than 1.7%'
Noising Answers:
(b) 'Between 1.7% and 2.2%, inclusive'
(c) 'More than 2.2% but less than 2.9%'
(d) '2.9% or more'

Question: Who will win the 2020 Georgia Democratic primary?
Correct Answer: 'Joe Biden'
Noising Answers:
(b) 'Michael Bloomberg'
(c) 'Pete Buttigieg'
(d) 'Someone else'

Question: Before July 2020, will it be officially announced that the Tokyo 2020 Summer Olympics and/or Paralympics will be postponed, canceled, and/or relocated?
Correct Answer: Yes, the Olympic Games only
Noising Answers:
(b) 'Yes, the Paralympic Games only'
(c) 'Yes, both'
(d) 'No'

Input:
Question 1: {}
Correct Answer 1: {}

Question 2: {}
Correct Answer 2: {}

Output: Now please generate three noising answers to the question, given the above article, instructions and examples. DO NOT output the backgrounds, the question or any other explanations.
Noising Answers 1:
(b) xxx.
(c) xxx.
(d) xxx.

Noising Answers 2:
(b) xxx.
(c) xxx.
(d) xxx.

Figure 22: Prompt in the *Misleading Choices Generation* step, adapted from Zhang et al. (2024).

Task
Please help evaluate the quality of question-answer pairs derived from the given news article. The questions will be presented to someone who has not seen the corresponding news article, in order to evaluate the accuracy and plausibility of the event prediction ability.

Inputs
Article: {}
Publishing Date: {}
Question 1: {}
Answer 1: {}
Question 2: {}
Answer 2: {}
Question 3: {}
Answer 3: {}
Question 4: {}
Answer 4: {}

Scoring Categories
Correctness: Given the above article, please check if the answer is correct to the question with 100% certainty.
- 2 points: There is evidence in the article that the answer is correct with 100% certainty.
- 1 point: The answer generally aligns with the news facts but has minor inaccuracies or missing details.
- 0 point: Significantly misaligned with the news facts.

Only Answerable on Publishing Date: Imagine traveling back in time to one week before the article's publishing date ({}). At that time, you are asked the question without having seen this specific article, but you do have access to all earlier news articles. The question should ideally be only guessable—not definitively answerable—based on the information available at that time. That is, the answer should be able to be found in the given article, but it should not be obtainable from earlier articles. Note that past tense descriptions in the article DO NOT INFLUENCE this assessment.
- 2 points: The question is answerable on {}, but only guessable not answerable before {}.
- 1 point: Could be somewhat predicted before {}, but not with complete certainty.
- 0 point: A person (could be anyone, even an expert in the field) would be able to find an article (or many) published before {} that answers the question with 100% certainty.

0 point examples
Example 1:
Question: What will be one of Lexi Thompson's career highlights in professional golf?
Answer: Winning 11 LPGA Tour titles.
Reasoning: This question is answerable with prior knowledge and does not test predictive ability related to the publishing date.

No New Information: Ensure the question does not include new information that only became known on the publishing date, making it understandable for a past audience.
- 2 points: No new information from the publishing date are included.
- 1 point: Minor new information from the publishing date might be inferred but are not explicitly stated.
- 0 point: Includes clear new information from the publishing date, unsuitable for past understanding.

0 point examples
Example 1:
Question: Will owners of the 2002-2006 Nissan Sentra, 2002-2004 Nissan Pathfinder, and 2002-2003 Infiniti QX4 heed the NHTSA's advice to immediately stop driving their vehicles in late May 2024?
Reasoning: This question contains new information on the publishing date. People from the past would not have known the "NHTSA's advice".

Figure 23: Prompt in the *QA Filtering* step (part 1).

Example 2:
Question: "What will Lexi Thompson's ranking be at the time of her retirement announcement in May 2024?"
Reasoning: This question contains the information that Lexi will annouce her retirement, which is not known to the people from the past.

Example 3:
Question: "Will the newly discovered children's sketches at the archaeological park of Pompeii be available for public viewing by May 2024?"
Reasoning: This question includes future events about newly discovered children's sketches in Pompeii, which wouldn't be known to a past audience

Objectiveness: The answer should not rely more on the author's personal views than on objective facts.
- 2 points: Completely objective, based strictly on reported facts.
- 1 point: Primarily objective, with minor subjective interpretations.
- 0 point: Largely subjective or opinion-based, lacking a factual basis.

Clear Time Element: This category checks if the question has a clear element in it, without having vague phrases like "in the future" or "in the upcoming weeks".
- 2 points: The question has clear time elements, like "by May 2024" or "in July 2023".
- 1 point: The question includes a general timeframe, like "next month" or "this winter," which allows for some estimation but lacks precise dates.
- 0 point: The question includes vague time phrases like "in the future" or "in the upcoming weeks," which do not specify a clear or precise timeframe.

0 point examples
Example 1:
Question: Will extreme heat events continue to pose a threat to India's development in the upcoming years?
Reasoning: The time constraint "in the upcoming years" is vague.

Example 2:
Question: "What will Illinois require from parents who monetize their children's online activities starting in July?"
Reasoning: The mention of "July" specifies only the month and lacks the necessary detail of the year.

Public Interest: Determine if the question addresses a topic of public concern.
- 2 points: The question covers a topic that widely affects or interests the public.
- 1 point: The question is of moderate interest, relevant to specific groups.
- 0 point: The topic is overly personal or localized, lacking relevance to the broader public.

0 point examples
Example 1:
Question: Will the exhibition 'Fragile Beauty' at London's Victoria & Albert Museum include both midcentury and contemporary works in May 2024?
Reasoning: The specific details of an personal art exhibition's contents are generally of limited public interest.

Answer Not Too Obvious: This category evaluates whether the answer to a question is too predictable or straightforward based on the question itself.
- 2 points: The answer provides new or non-obvious insights, requiring additional context or understanding not explicit in the question.
- 1 point: The answer is somewhat predictable but includes minor additional information or a slight twist.
- 0 point: The answer directly restates or closely mirrors the question, offering no new details or insights.

Figure 24: Prompt in the *QA Filtering* step (part 2).

0 point examples
Example 1:
Question: What will New York officials do to ensure safety for the ICC Men's T20 Cricket World Cup following global threats from ISIS-K?
Answer: New York officials will implement increased safety precautions for the event.
Reasoning: The answer is straightforward and expected, as it directly restates the premise of the question without providing any new or specific details on how the safety precautions will be implemented or what they might entail.

Instructions
Evaluate each question-answer pair by assigning points in each of the categories based on the criteria provided. Please be strict on giving points. If the requirements of a category are not fulfilled, assign a point of 0.

Please strictly follow this output template:
Question 1
Correctness
- Reasoning:
- Point:
Only Answerable on Publishing Date
- Reasoning:
- Point:
No New Information
- Reasoning:
- Point:
Objectiveness
- Reasoning:
- Point:
Clear Time Element

Question: {}
Options:
- Science & Tech
- Healthcare & Biology
- Economics & Business
- Environment & Energy
- Politics & Governance
- Education & Research
- Arts & Recreation
- Security & Defense
- Social Sciences
- Sports
- Other
Instruction: Assign a category for the given question.
Rules:
1. Make sure you only return one of the options from the option list.
2. Only output the category, and do not output any other words in your response.
3. You have to pick a string from the above categories.
Answer:

Figure 33: Prompt to categorize the generated questions, taken from Halawi et al. (2024).
