

fine-grained capability report across multiple dimensions (e.g., application, input type, output format, skill), allowing users to interact with and visualize model capabilities in depth. We evaluate a wide variety of frontier vision-language models on MEGA-BENCH to understand their capabilities across these dimensions.

1 INTRODUCTION

Large foundation models (OpenAI, 2023; 2024a; Anthropic, 2024a; Google, 2023; Meta, 2024; Alibaba, 2024) have dramatically transformed the landscape of artificial intelligence by showcasing exceptional capabilities across various tasks and domains. Originating in the realm of natural language processing, these models have progressively expanded to perceive and interpret multimodal information, including single images, multiple images, and videos. Previously, multimodal models were mainly used for standardized tasks like image captioning (Lin et al., 2014), video captioning (Wang et al., 2019), and visual question answering (Antol et al., 2015; Goyal et al., 2017; Xiao et al., 2021). With the recent progress on multimodal alignment, these models have shown great potential to solve many diverse and complex tasks with well-designed prompts. As a result, people have applied them to assist with many realistic tasks like “web navigation” (Koh et al., 2024), “game playing” (Valevski et al., 2024), “travel planning” (Xie et al., 2024), “visual navigation” (Wang et al., 2023a), “sports analysis” (Xia et al., 2024), “visual entity recognition” (Hu et al., 2023), “visual quality assessment” (Ku et al., 2024), and more. These efforts have significantly increased the utility of multimodal models.

An important challenge is identifying how to accurately gauge the abilities of these vision-language models (VLMs) across a wide range of tasks. Most existing benchmarks are designed to cover only one or a few similar tasks, making them inadequate for evaluating the models’ overall capabilities. The status quo is to evaluate the model on many existing benchmarks to showcase their all-round abilities. For example, Qwen2-VL¹ was evaluated on 27 image and video benchmarks in total. Although this massive evaluation effort provides valuable insights into how well these models handle specialized tasks, it also introduces a significant overhead and several challenges:

- **Limited Output Diversity:** The existing multi-task benchmarks like MMMU (Yue et al., 2024a), MMT-Bench (Ying et al., 2024) rely heavily on multiple-choice questions to lower the burden of evaluation. This fails to evaluate the generative abilities of these multimodal models.

- **Lack of Task Coverage:** The existing benchmarks are often sporadic and lack a systematic design to cover the multimodal task space. Certain abilities are not well covered in the current ecosystem. Consequently, even exhaustively testing all the available benchmarks would not be sufficient.

- **Expensive Inference Cost:** The full evaluation process is expensive regarding computation cost/time or API expense. Since many examples or tasks are similar in the capabilities they assess (e.g., DocVQA Mathew et al. (2021) alone has thousands of examples for examining doc understanding and OCR-related abilities), overly repetitive evaluation at a large scale leads to resource waste.

- **Unmanageable Setups:** Each benchmark has complexities when setting up the evaluation. For example, VQA (Goyal et al., 2017) alone has four splits (val, dev-test, std-test, and test). It is hard to track the exact setup of different baseline models to ensure a fair comparison.

To address these challenges, we advocate for a unified protocol that scales up multi-modal evaluation to *maximize the task coverage and the diversity in model outputs while optimizing the inference cost*. As an initial attempt, we propose MEGA-BENCH, which is designed to provide a comprehensive and systematic assessment of multimodal foundation models.

To build MEGA-BENCH, we first construct a *task taxonomy tree* that organizes different multimodal tasks based on the application type (Figure 1), with significant effort spent adjusting and refining the taxonomy tree to ensure sufficient coverage and diversity. The task taxonomy tree then serves as the guiding principle to ensure all relevant tasks and skills are covered and appropriately balanced. To help the annotators create their tasks, we build an annotation GUI to simplify the process of creating the task JSON files and a web tool to visualize the results of the VLM’s responses alongside the ground truth. We also review each task contribution when it is first submitted, after evaluating the models on the new tasks, and periodically throughout the annotation process to ensure that all of the tasks are novel and high-quality. This collaborative effort resulted in the compilation of 505 realistic

¹ <https://github.com/QwenLM/Qwen2-VL>

tasks, effectively covering (almost) the entire multimodal capability space at a manageable inference cost. To facilitate nuanced and precise evaluation, we also developed 45 *highly-customized metrics* tailored to these tasks during the annotation process.

Unlike existing benchmarks that often provide a single score, MEGA-BENCH offers a fine-grained capability report based on multiple dimensions such as the input type, input format, output format, and required skills. This interactive and visualizable report enables users to identify the models’ performance across several orthogonal dimensions, uncovering strengths and weaknesses that might be obscured in aggregate scores. Such detailed analysis is invaluable for researchers and developers aiming to enhance foundation models and optimize them for specific downstream applications.

Using MEGA-BENCH, we conducted comprehensive studies of popular flagship and efficiency models (with both open-source software and proprietary APIs) and identified some findings below:

1. Among flagship models, Claude 3.5 Sonnet (1022) and GPT-4o (0513) currently lead in performance across a wide range of multimodal tasks, with less than a 0.1% difference in their overall scores. Our detailed breakdown shows that Claude 3.5 Sonnet excels in planning and math with its latest upgrade bringing clear boosts in processing UI/Infographics inputs, while GPT-4o leads in information extraction and knowledge-intensive tasks.
2. Among open-sourced models, Qwen2-VL performs the best, with its performance near the top close-sourced flagship models, and outperforms the second best open-source model by $\approx 10\%$.
3. Among efficiency models, Gemini 1.5 Flash is the strongest model overall, except for the tasks related to handling User Interfaces and Documents.
4. Proprietary models can effectively leverage Chain-of-Thought (CoT) prompting to improve their performance, while open-source models hardly produce helpful reasoning processes. In our evaluation results, 10 of 13 open-source models get worse results with CoT prompting.

2 RELATED WORK

Multimodal benchmarks. Benchmarking in vision-language models has been a long-standing research problem. Before the era of large multimodal models, most benchmarks were designed for specific tasks or skills. Some benchmarks like VQA (Antol et al., 2015), GQA (Hudson & Manning, 2019), and ViswizVQA (Gurari et al., 2018) focus on photograph or natural images. ChartQA (Masry et al., 2022), InfoVQA (Mathew et al., 2022), DocVQA (Mathew et al., 2021), and OCR-VQA (Mishra et al., 2019) focus more on documents, infographics, and other similar media. Later on, there was a trend to build more well-rounded benchmarks to cover a wider range of skills or topics, such as ScienceQA (Lu et al., 2022), MMBench (Liu et al., 2023b), MMMU (Yue et al., 2024a;b), MMT-Bench (Ying et al., 2024), and more. However, due to the diversity of these different tasks, most benchmarks use multiple-choice questions for all problems. Therefore, these benchmarks cannot fully reflect the generational abilities of multimodal models. Complementary to this, LMSys arena (Chiang et al., 2024) and WildVision arena (Lu et al., 2024) have proposed to use user voting and Elo-ranking to benchmark multimodal models. Our benchmark is the first to scale up the tasks by a significant magnitude. Furthermore, our benchmark provides a breakdown report to analyze multimodal models across multiple dimensions.

Sensitivity of large model leaderboards to input format. Creating reliable leaderboards poses a substantial challenge for evaluating large models. Previous studies have noted that LLMs exhibit sensitivity to minor input modifications, including prompts and in-context examples in few-shot settings (Sclar et al., 2024; Chang & Jia, 2023). To mitigate input sensitivities, researchers have developed specialized prompt design and prompting-based training approaches (Liu et al., 2023a; Jain et al., 2024b). Nonetheless, for benchmarks that only allow a multiple-choice format (Wang et al., 2024d), studies by Zheng et al. (2024) and Robinson et al. (2023) find the option sequencing can significantly alter model rankings on the leaderboard. Recently, Alzahrani et al. (2024) explores the advantage of a hybrid scoring method to stabilize models’ leaderboard rankings over input format. Though MEGA-BENCH does not include hybrid scoring for each individual task, the overall use of diverse and hybrid scoring methods and output formats across more than 500 tasks demonstrates *the robustness of the benchmark*.

Figure 2: MEGA-BENCH’s four keyword dimensions and the task-level statistics. The diversity along various dimensions enables fine-grained capability analysis.

3 MEGA-BENCH

MEGA-BENCH is a comprehensive multimodal benchmark that spans 7 input formats, 6 output formats, 10 different types of skills, and a varying number of visual inputs, whether single-image, multi-image or from video, as shown in Figure 2. Our benchmark covers 8 distinct subject areas in a hierarchical taxonomy to evaluate VLMs’ ability to tackle various tasks.

3.1 BENCHMARK CONSTRUCTION PROCESS

Preparation. Figure 3 illustrates our annotation process. In the conceptualization stage, we propose a “draft” task taxonomy tree with the top two levels of Figure 1 by getting inspirations from existing multi-task or multi-discipline LLM/VLM benchmarks (Srivastava et al., 2022; Liu et al., 2023b; Yue et al., 2024a). The first level consists of general applications like “perception”, “planning”, “reasoning”, etc., while the second level has more concrete meta-tasks like “document understanding”, “app function understanding”, “logic reasoning”, etc. We host a brainstorming session to add exemplars under each second-level node and write descriptions about the number and quality of the tasks we expect. Based on our empirical observations of how general users use VLMs in real-world scenarios, we assign more task budgets to perception, knowledge, and information extraction than other first-level nodes while strictly monitoring the application-level distribution balance in the annotation process. We then distribute the second-level nodes in the “draft” tree to the annotators. This top-down framework minimizes overlaps between annotators and facilitates overall organization.

Figure 3: The annotation process of MEGA-BENCH. We propose a “draft” taxonomy tree and then distribute the second-level nodes to annotators. We allow the annotators to gradually refine the tree structure as they add new tasks. Each task has many examples and a shared task-level instruction. Each example has a question and a ground truth answer.

To ensure reliable commitment and annotation quality, we call up 16 designated expert annotators with rich LLM experience and computer science backgrounds. All annotators are graduate students or above with majors in computer science, electronics/communications engineering, bio-statistics, or finance, and 12 of them served as annotators or authors of LLM/VLM benchmarks published at top conferences. The annotators can 1) refine the “draft” taxonomy by adding/deleting nodes, 2) add “task group” nodes and then add a series of tasks under that, and 3) directly add tasks under an existing high-level node. We develop tools to facilitate the annotation process, including 1) an interactive annotation tool that defines the annotation format and automatically unifies all annotations into JSON files, 2) a GitHub repository to coordinate the task submission, reviewing, and discussion process, which was inspired by BIG-bench (Srivastava et al., 2022), and 3) a visualization tool that

allows annotators to browse the existing tasks and the evaluation results of representative vision language models (VLMs). We coordinate all the annotators to ensure they understand our expectations and continuously improve our tools. Please see §B for complete details of annotation protocols.

Task annotation. The annotation process contains two rounds. The annotators submit tasks to the benchmark by creating pull requests (PR) to the main branch of our GitHub repository. In the first round of the annotation process, we ask the annotators to contribute 20 tasks following the principles below to ensure the quality of the task:

- *Data source and output format:* Creative tasks with diverse data sources and output formats are encouraged. If the data was collected from existing datasets, we ask annotators to adapt the original annotation into more specific questions and design more diverse answer formats.
- *Number of examples:* Each task should have at least 15 examples. Exceptions are allowed for some complicated tasks where the data are scarce.
- *Documentation:* Each task should be accompanied by documentation that indicates the source of the data, the capabilities the task tries to evaluate, and the evaluation metric to be used.

Our core contributors review each PRs carefully to provide feedback, and the accepted PRs are merged into the main branch. We periodically run the evaluation with commercial VLMs (e.g., GPT-4o) and update the results of existing tasks on our visualization page, which allows the annotators to better understand the difficulty of their tasks and catch potential glitches in the annotation. We found that this helps significantly improve the annotation quality.

Before the second round of annotations, the core contributors review all tasks in the taxonomy tree and investigate the biases in the task distribution. We then host another annotator session to propose new meta-tasks to balance the distribution and maximize the coverage. We then distribute the updated tree nodes to annotators and employ the same guidelines to finish the second-round annotations. After this round, each annotator contributes at least another 30 tasks.

Quality control and refinement. We leverage commercial VLMs to examine the task quality. Concretely, we gather the results of GPT-4o, Claude 3.5 Sonnet, and Gemini 1.5 Pro and compute an average score on each task. Tasks with almost 1.0 scores often have trivial questions (based on manual inspection) and can hardly distinguish the ability of different models. We ask the corresponding annotators to investigate and augment those tasks. For tasks with almost zero scores, the task reviewers audit them carefully and remove them if the zero score comes from incorrect annotations or insufficient instruction contexts. Finally, the benchmark contains a total of 505 tasks with roughly 8,200 examples, which is large enough to minimize the sample variance within each high-level taxonomy node. Please refer to §4.3 for an analysis of the number of examples per task.

3.2 METRICS FOR ANSWERS IN DIVERSE OUTPUT FORMATS

To properly evaluate the tasks with different output formats, we develop a set of *highly-customized evaluation metrics* in parallel with the benchmark construction process (§3.1). Figure 4 shows several examples of the model outputs along with the task’s associated metrics. When new tasks are submitted to our GitHub repository, we implement any new metrics specified by the task authors. We use two types of metrics: rule-based metrics and LLM-assisted metrics. All metrics are normalized into [0, 1], with 1.0 being the full mark.

Rule-based metrics. When there is a unique answer under the question context or the correctness of the answer can be verified by rules (e.g., if the generated story/poetry meets the desired formats or if the generated code can pass test cases), we implement *rule-based* metrics for evaluation. To satisfy the needs of all tasks submitted by annotators, we end up with a suite of over 40 rule-based metrics. Robust string parsing is also implemented to extract the answer from the model’s response. We conduct a sanity check to ensure the correct implementation of rule-based metrics. Specifically, we create an “oracle” model that always returns the ground truth, then compute its score over all tasks evaluated by rule-based metrics. The sanity check is passed when the “oracle” model gets a full 1.0 score. See §D.4 for details.

LLM-assisted metrics. For open-ended tasks that do not have a unique answer, we instead employ an *LLM-assisted* metric (Zheng et al., 2023; Li et al., 2023a). We design a per-task evaluation prompt template and fill in the tailored evaluation criteria for each task. The LLM is instructed to compare

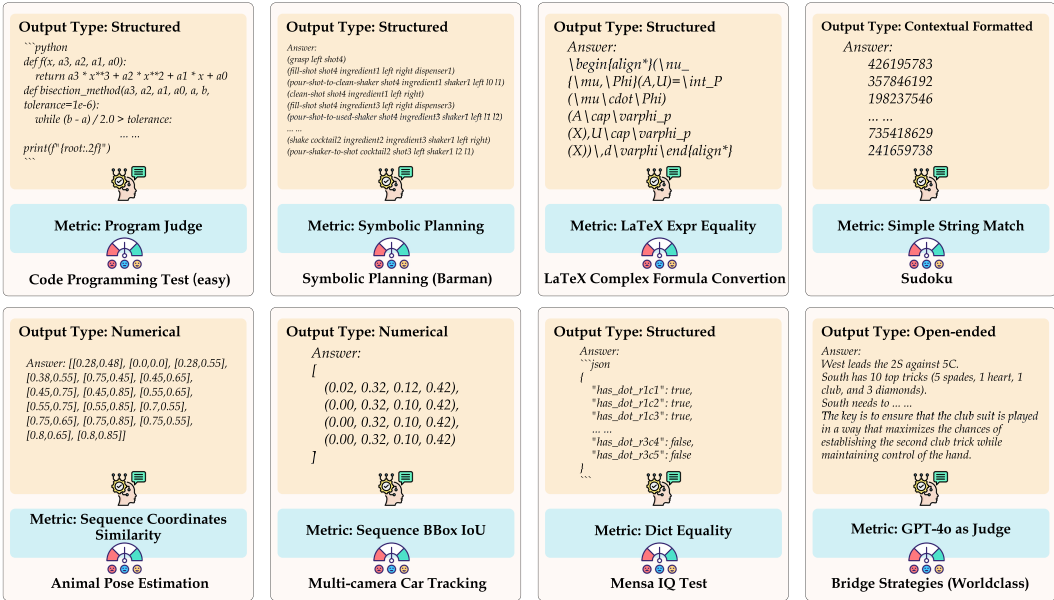

Figure 4: Representative examples of MEGA-BENCH’s diverse output formats and customized metrics (input queries are omitted). The outputs are extracted from *real responses* of GPT-4o (0513). We implement robust parsing to extract the final answer from raw model responses.

the model response with the reference answer and assign a score from 1 to 10. The score is then normalized into [0, 1] to be consistent with the other metrics. See §D.3 for details.

We divide the tasks into two subsets based on the different evaluation processes. The *Core Set* is evaluated with rule-based metrics to make the evaluation fast and cost-free. The *Open-Ended Set* is evaluated with metrics that use an LLM-as-a-judge, where the evaluation pipeline calls a proprietary LLM over an API. Specifically, we use GPT-4o-0806 (OpenAI, 2024a) as the judge LLM while maintaining an extensible implementation for using other judge models. The Core and Open-Ended sets contain 440 and 65 tasks, respectively.

3.3 MULTI-DIMENSIONAL KEYWORDS FOR FINE-GRAINED ANALYSIS

Existing multi-task multimodal benchmarks analyze models according to dimensions like the image type and academic discipline (Yue et al., 2024a), ability (Liu et al., 2023b), or meta-task (Ying et al., 2024). MEGA-BENCH offers a broad and diverse range of coverage across all these dimensions, and extends even further beyond them. As explained in §3.1, the taxonomy tree divides the tasks into general application scenarios, the most manageable dimension for distributing the annotation efforts to different annotators. After we collected all tasks and finished the quality control process, we grouped all tasks based on four extra dimensions: input visual type, input visual number, output format, and required skills (Figure 2). Each dimension has 6 to 10 keywords, enabling fine-grained analysis and comparison. Interactive visualization tools can then be developed based on our evaluation results, which allows model developers to delve deep into different aspects of a model and compare different models comprehensively.

3.4 DATASET STATISTICS AND COMPARISON WITH OTHER BENCHMARKS

MEGA-BENCH contains 505 real-world tasks with 8,186 manually annotated or repurposed samples. Even for repurposed data, considerable effort is needed to convert the original annotations into specific task descriptions, diverse output formats, and additional instructions to include auxiliary information about formatting. Figure 2 shows the task distribution of all five dimensions, and the detailed task taxonomy tree and statistics of each dimension are in Appendix C.

Table 1 compares MEGA-BENCH to existing multimodal benchmarks. The key feature of our benchmark is the diversity across all aspects, driven by our high-level designs of diverse task appli-

Table 1: A comparison between MEGA-BENCH and existing works. MEGA-BENCH has a greater diversity in data sources, input/output format, the number of metrics, and the number of tasks.

Dataset	Annotation	Source	Input	Output	#Metrics	#Tasks
VQA-v2 (Antol et al., 2015)	New	Photo	1 Image	Phrase/Bool/Num	1	1

MVBench (Li et al., 2024e)	Repurposed	Existing	Video	Multi-choice (MC)	1	20
MMT-Bench (Ying et al., 2024)	Repurposed	Existing	≥1 Image/Video	Multi-choice (MC)	1	162
MEGA-BENCH	New	Diverse	≥1 Image/Video	Unrestricted	45	505

cations and output formats. MMMU (Yue et al., 2024a;b) focuses on college-level exam questions with various discipline and image formats. All questions are single-image and answered in multiple-choice format. MMT-Bench (Ying et al., 2024) covers 162 concrete sub-tasks, enabling in-depth analysis based on their “taskonomy” and diverse input forms. However, all of the tasks MMT-Bench are from existing datasets, mostly under the “Perception” sub-tree in our taxonomy, and all outputs are in multiple-choice form like MMMU. To maximize task coverage and the diversity in model outputs with cost-effective inference, MEGA-BENCH includes a much broader range of task types and output formats, while having fewer total samples compared to existing benchmarks.

4 EXPERIMENTS

We evaluate 19 VLMs with multi-image support on MEGA-BENCH. §4.1 describes the evaluated models and the evaluation pipeline. §4.2 presents the evaluation results with a fine-grained analytical breakdown. §4.3 provides analyses on the number of examples per task and error types.

4.1 EVALUATION SETTINGS

Evaluated models. We evaluate a diverse range of large multimodal models. The proprietary models assessed include GPT-4o (0513) and GPT-4o mini (OpenAI, 2024a), Claude-3.5-Sonnet (0620 and 1022) (Anthropic, 2024a;b), Gemini-1.5-Pro (002) and Gemini-1.5-Flash (002) (Google, 2024a). For open-source models, we mainly focus on large flagship (>70B parameters) and small-to-medium efficiency models. The large models include Qwen2-VL-72B (Alibaba, 2024), InternVL2-Llama3-76B (Chen et al., 2024d), LLaVA-OneVision-72B (Li et al., 2024a), and NVLM (Dai et al., 2024). The medium-scale models comprise Qwen2-VL-7B (Alibaba, 2024), Pixtral 12B (Mistral, 2024), Aria (Li et al., 2024d), InternVL2-8B (Chen et al., 2024d), Phi-3.5-Vision (Abdin et al., 2024), MiniCPM-V2.6 (Yao et al., 2024), LLaVA-OneVision-7B (Li et al., 2024a), Llama-3.2-11B Meta (2024), and Idefics3-8B-Llama3 (Laurençon et al., 2024).

Evaluation pipeline. MEGA-BENCH has diverse and flexible formats. To ensure the models have clear instructions on the output format, we provide all evaluated VLMs with a one-shot in-context example. For each query, we fill in a pre-defined prompt template with the task instructions written by the task annotators, the 1-shot example, and the concrete query question. Since this one-shot

Table 2: The main results of different models on the Core and Open-ended subset of MEGA-BENCH, with 440 and 65 tasks, respectively. We report the macro mean scores across all tasks in each set. The overall score is the weighted average of the Core and Open-ended scores. When computing the overall score, we use the higher Core score from ‘w/o CoT’ and ‘w/ CoT’.

Model	Eval Tier	Open Source	Core (rule eval)		Open-ended (GPT eval)	Overall
			w/o CoT	w/ CoT		
Claude-3.5-Sonnet (1022) (Anthropic, 2024b)	Flagship	No	49.20	52.59	65.63	54.27
GPT-4o (0513) (OpenAI, 2024a)	Flagship	No	52.03	52.65	64.78	54.21
Claude-3.5-Sonnet (0620) (Anthropic, 2024a)	Flagship	No	48.80	50.41	63.74	52.13
Gemini-1.5-Pro-002 (Google, 2024b)	Flagship	No	46.99	48.22	58.58	49.55
Gemini-1.5-Flash-002 (Google, 2024b)	Efficiency	No	41.90	41.89	56.91	43.82
GPT-4o mini (OpenAI, 2024b)	Efficiency	No	39.85	40.77	58.65	43.07
Qwen2-VL-72B (Alibaba, 2024)	Flagship	Yes	46.41	45.42	56.40	47.70
InternVL2-Llama3-76B (Chen et al., 2024d)	Flagship	Yes	35.02	35.63	51.93	37.73
LLaVA-OneVision-72B (Li et al., 2024a)	Flagship	Yes	31.99	29.74	45.99	33.79
NVLM-72B (Dai et al., 2024)	Flagship	Yes	24.21	21.59	34.78	25.57
Qwen2-VL-7B (Alibaba, 2024)	Efficiency	Yes	34.80	32.93	43.96	35.98
Pixtral-12B (Mistral, 2024)	Efficiency	Yes	31.91	31.36	45.66	33.68
Aria-MoE-25B (Li et al., 2024d)	Efficiency	Yes	30.49	28.90	51.03	33.13
InternVL2-8B (Chen et al., 2024d)	Efficiency	Yes	25.96	24.09	39.79	27.74
Phi-3.5-Vision-4B (Abdin et al., 2024)	Efficiency	Yes	23.27	23.00	39.48	25.36
MiniCPM-V2.6-8B (Yao et al., 2024)	Efficiency	Yes	22.88	22.96	41.73	25.38
LLaVA-OneVision-7B (Li et al., 2024a)	Efficiency	Yes	22.41	21.36	33.98	23.90
Llama-3.2-11B (Meta, 2024)	Efficiency	Yes	10.04	16.00	31.73	18.02
Idefics3-8B-Llama3 (Laurençon et al., 2024)	Efficiency	Yes	11.12	8.96	32.11	13.82

example’s primary purpose is to illustrate the output format, we allocate it a tiny portion of the total image budget. For each model, we conduct experiments with and without Chain-of-Thought (CoT) prompting (Wei et al., 2022) for the Core tasks. Full evaluation details are in §D. Our default evaluation pipeline focuses on models with multi-image support. To properly evaluate models trained mainly for single-image use cases, we create a single-image setting using the single-image tasks of MEGA-Bench. See §A for the detailed results and analyses of the single-image setting.

4.2 MAIN RESULTS WITH BREAKDOWN ANALYSIS

Table 2 presents the main evaluation results, while Figure 5 and Figure 6 are the fine-grained breakdowns enabled by MEGA-BENCH’s multi-dimensional diversity. This section discusses some important findings, and the full breakdown results are in §E. We organize the evaluated models into two tiers: (1) The *Flagship Model Tier* compares the strongest performing models from each model’s organization, (believed) with #params ≥ 70 B. (2) The *Efficiency Model Tier* compares efficiency models from each model’s organization, (believed) with #params ≤ 20 B.

Flagship models. Unlike the results on recent benchmarks like MMMU-Pro (Yue et al., 2024b) where GPT-4o (0513) and Claude-3.5-Sonnet (0620) get close scores, GPT-4o (0513) outperforms Claude-3.5-Sonnet (0620) with a clear margin on MEGA-BENCH ($> 2\%$). Investigating the breakdown results, we observe that GPT-4o (0513) wins in most applications/skills except for coding, math, and planning-related tasks, where the answers are typically in a “structured” output format (Figure 5). The recent update of Claude-3.5-Sonnet (1022) makes improvements across almost all dimensions, especially in planning tasks and those with infographics/UI/photographs inputs, and slightly surpasses GPT-4o in the overall score ($< 0.1\%$). The “planning” application keyword contains tasks like symbolic planning (Zhu et al., 2024), navigation (Ku et al., 2020), chess games (Fu et al., 2024b), puzzle games (e.g., maze, Sudoku), etc., and even the best models get low scores.

One typical observation of Claude-3.5-Sonnet models is that they tend to be meticulous and refuse to answer routine knowledge or commonsense questions, such as the name and nationality of famous actors. The bottom radar maps show that they fall behind in knowledge, information extraction, and commonsense reasoning compared to GPT-4o, partially because of this refusal behavior.

The evaluation results suggest that Qwen2-VL performs particularly well amongst open-source models of similar parameter sizes. In Figure 5, Qwen2-VL-72B gets a similar score to closed-source

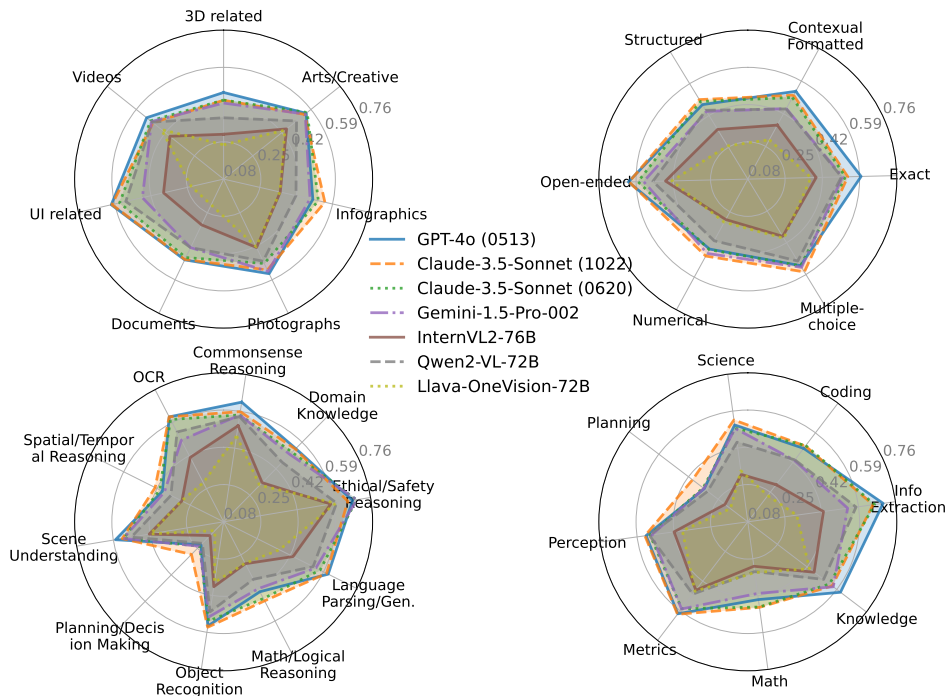

Figure 5: Fine-grained breakdown analysis of flagship models on four dimensions. From top-left to bottom-right: input format, output format, skills, and application.

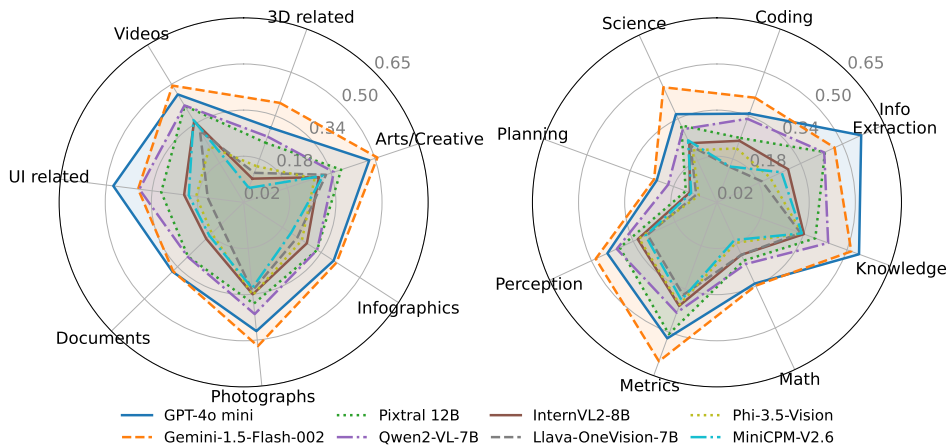

Figure 6: Fine-grained analysis of efficiency models on input format (left) and application (right).

models in the general perception category and outperforms Gemini-1.5-Pro-002 on information extraction tasks. Llava-OneVision-72B scores very low when the visual inputs are in “UI related” and “Document” formats while performing well on video inputs. This suggests a lack of OCR and language parsing abilities, which can be confirmed with its skills radar plot.

Efficiency models. Figure 6 analyzes the results on efficiency models. In general, Gemini-1.5-flash-002 has the best performance with exceptional scores in Science and Metrics applications. The Metrics keyword contains tasks such as rating the quality of GenAI results (He et al., 2024; Jiang et al., 2024b) and requires deep multimodal reasoning and commonsense. However, its performance on UI-related inputs and information extraction tasks falls behind GPT-4o mini.

Chain-of-Thought. An interesting finding is that the CoT prompt (See §D) effectively guides all proprietary models to generate a detailed reasoning process, and flagship-tier proprietary models all obtain better performance on the Core set. However, it has almost no effect on most open-source models. For example, the Qwen2-VL, InternVL2, and LLaVA-OneVision models rarely

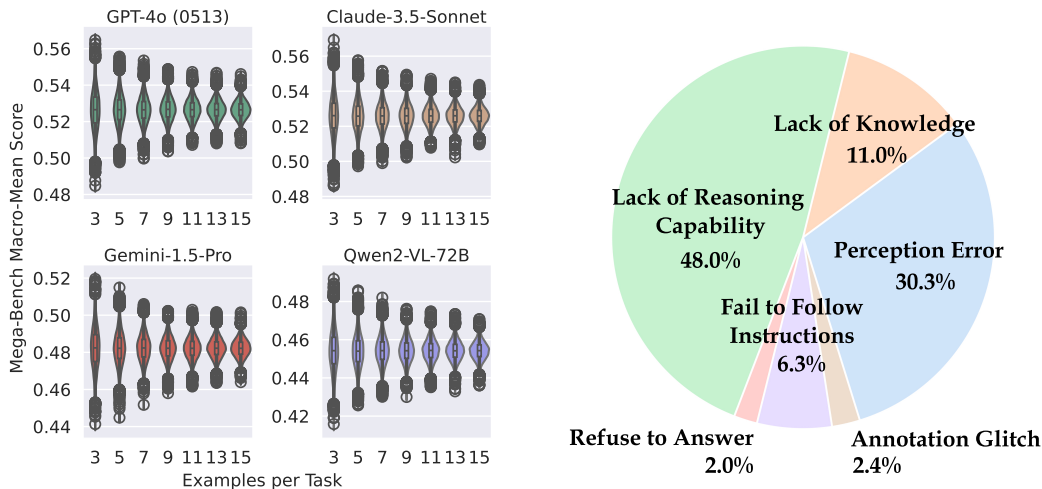

Figure 7: (Left) The bootstrap distribution of benchmark scores (w/ CoT prompting) with a gradually increased bootstrap sample size of the number of per-task examples. (Right) The task-wise error distribution of GPT-4o (0513) over a subset of 255 Core tasks.

produce reasoning with a CoT instruction, and sometimes get confused about the required format after generating the reasoning process, leading to a lower score on the Core set.

Some open-source models get comparatively low scores for their parameter count (e.g., Llama-3.2-11B, Idefics3). One typical difficulty is leveraging the one-shot example to understand the output format, which is alleviated with CoT because the prompt provides extra instructions on the output format beyond the one-shot example. The lack of multi-image ability is another bottleneck of these models, and §A presents a single-image setting of MEGA-BENCH with further analyses.

4.3 MORE ANALYSIS

Number of samples per task. As discussed in §1, one of MEGA-BENCH’s goals is optimizing the inference cost while producing comprehensive breakdown analyses, making us prioritize the task diversity over examples per task in the benchmark construction process. To understand the robustness of the benchmark score with 15 examples per task, we obtained bootstrap distributions (Efron & Tibshirani, 1994; Hesterberg, 2011) of the model scores for our Core set with CoT. We did this by taking a random subset of the model’s responses of size n ($n = 3, 5, \dots, 15$) with replacement for each task and calculating the task-level macro-mean scores. To ensure the bootstrap distribution was numerically stable, we ran 10,000 Monte Carlo simulations. Figure 7 (left) shows that the variance in model scores rapidly narrows as the number of examples per task increases. As the number of examples per task increases beyond 7, the marginal return in variance reduction diminishes.

Error analysis. To understand the limitations of state-of-the-art VLMs, we analyze the GPT-4o (0513) results by manually identifying the error types over a subset of 255 tasks from the Core set. We use the CoT setting since the reasoning process helps determine the error type. Figure 7 (right) presents the error distribution. For GPT-4o, the lack of various reasoning capabilities (e.g., symbolic reasoning for planning/coding tasks, spatial or temporal reasoning for complex perception tasks, etc.) is the dominating failure mode on MEGA-BENCH. Please refer to §F for the full definition of error types and detailed example-wise inspection results with different models.

5 CONCLUSION

This paper presents MEGA-BENCH, a comprehensive benchmark that scales multimodal evaluation to over 500 real-world tasks but at a manageable inference cost. By systematically organizing tasks across dimensions like skill, output format, and input type, we enable fine-grained analysis of multimodal models. Our evaluation of state-of-the-art VLMs revealed significant performance variations between models that previously seemed similar. MEGA-BENCH provides a new standard for multimodal evaluation, offering a robust analysis tool for model development.

ACKNOWLEDGMENT

We would like to thank Vector Institute for their support throughout this research. We also express our gratitude to Tung Vu from GreenNode for providing access to GPUs, which were instrumental in running some of the evaluation experiments. Additionally, we appreciate the contributions of all open-source language model providers, whose efforts have significantly propelled the advancement of research in this field.

A SINGLE-IMAGE SETTING: RESULTS AND ANALYSES

Table 2 in the main paper focuses on models with multi-image support. However, some open-source models are only trained with single images. To provide a feasible evaluation setting for these models, we create a single-image (SI) setting using the single-image tasks in MEGA-BENCH, containing 273 and 42 tasks from the Core and Open-ended sets, respectively.

Evaluation setup. The Chain-of-Thought (CoT) prompting is used for Core SI tasks. To make the entire query contain only one image as needed by some single-image models, we drop the image input of the 1-shot demonstration example (“✗ demo im” column in the table). In this case, the 1-shot example only demonstrates the output format, which is necessary for inferring the correct answer. For those models already evaluated in **Table 2**, we calculate the task-level average scores on single-image tasks to obtain the “✓ demo im” results. Compared to **Table 2**, 3 single-image models are evaluated and added: Molmo-72B-0924 (Deitke et al., 2024), Molmo-7B-D-0924 (Deitke et al., 2024), and POINTS-Qwen2.5-7B (Liu et al., 2024b).

Evaluation results. **Table 3** presents the evaluation results of the SI setting. The Core and Open-ended scores of the standard setting (with CoT prompting) are also in the table for reference. Some observations from the table are listed below:

- Single-image tasks are easier than multi-image tasks in general, and all models get higher scores in the SI setting than in the standard setting.
- GPT-4o has the best overall SI score, slightly higher than Claude 3.5 Sonnet (1022). Interestingly, GPT-4o mini overtakes Gemini-1.5-Flash-002 under the SI setting, suggesting that Gemini-1.5-Flash has pretty stable performance across different numbers of image inputs.
- NVLM-72B (Dai et al., 2024) has much better scores in the SI setting than in the standard setting, suggesting its training data might only contain single or a few images.
- Comparing the “✓ demo im” and “✗ demo im” results of open-source models, the image input in the 1-shot demonstration example is not well utilized by the models to better understand the task logic. Including the image input in the demonstration example makes the results much worse for models like Llama-3.2-11B.

More detailed breakdown results are available on our project page and the leaderboard (hosted with Hugging Face Spaces)

Table 3: The single-image (SI) setting results of MEGA-BENCH. The Core set evaluation uses Chain-of-Thought (CoT) prompting. The “demo img” means the image input of the 1-shot demonstration example. The “✓ demo im” directly takes the single-image subset average from the full results in Table 2. The “✗ demo im” means the 1-shot demonstration example only demonstrates the output format, and the entire query has a single image. We report “✓ demo im” alone for the proprietary models because they have good multi-image support. For open-source models, we do additional evaluations with the “✗ demo im” setting and use it to compute the overall score.

Model	Core	Core SI		Open	Open SI		Overall SI
		✓ demo im	✗ demo im		✓ demo im	✗ demo im

B DETAILS OF ANNOTATION PROTOCOLS

This section presents additional details of our task annotation pipeline and protocols, providing complete details for §3.1 of the main paper.

B.1 THE UNIFIED ANNOTATION FORMAT

Figure 8 presents the annotation format designed and used in our annotation process. All annotated tasks share this unified structure, including task instruction, *optional* global media to provide context to all the questions (typically used in retrieval-related tasks). Additionally, each specific example contains distinct media path(s), a concrete question, and an answer with a single or multiple answer fields. Multi-field answers are organized as JSON structures.

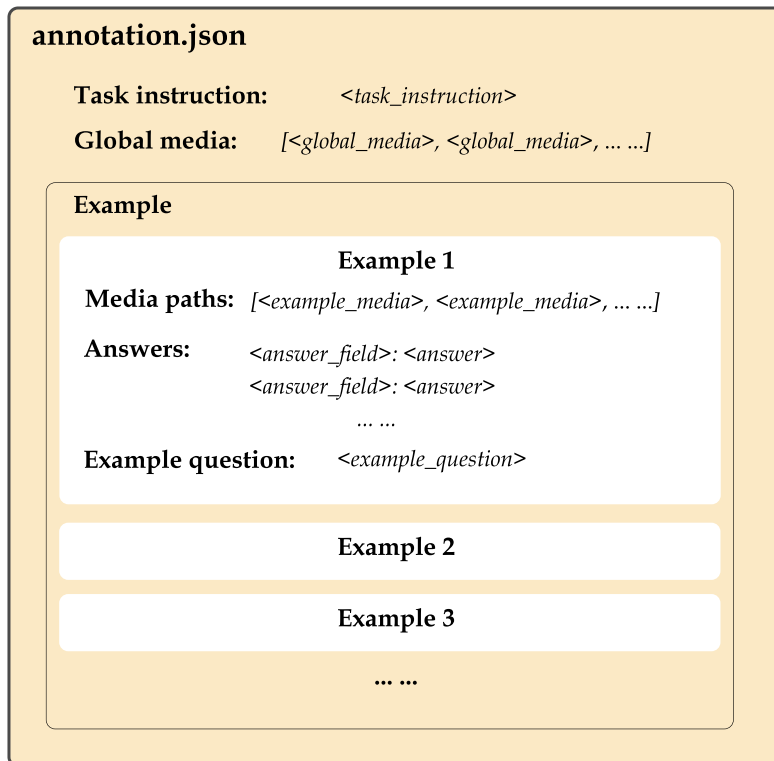

Figure 8: The structure of our task annotation format, which helps coordinate all task annotators and standardize the annotation format.

Our evaluation pipeline follows this format to convert the task information into concrete queries and feed them to the evaluated model. Based on this format, we establish an interactive annotation tool to ensure the tasks submitted by all annotators have the correct and unified format. **Figure 9** demonstrates the GUI of the annotation tool.

B.2 GENERAL TASK COLLECTION AND CREATION GUIDELINES

This subsection provides more detailed annotation guidelines for our annotators, complementing the descriptions in §3.1.

Data source of each task. There is no restriction on the data source as long as the annotator follows the copyright and license requirements of the original data. Below are three typical task types and their data sources:

- (1). The task is designed entirely by the annotator, and the annotator looks for the image or video resources from the Internet or even using code/simulator;

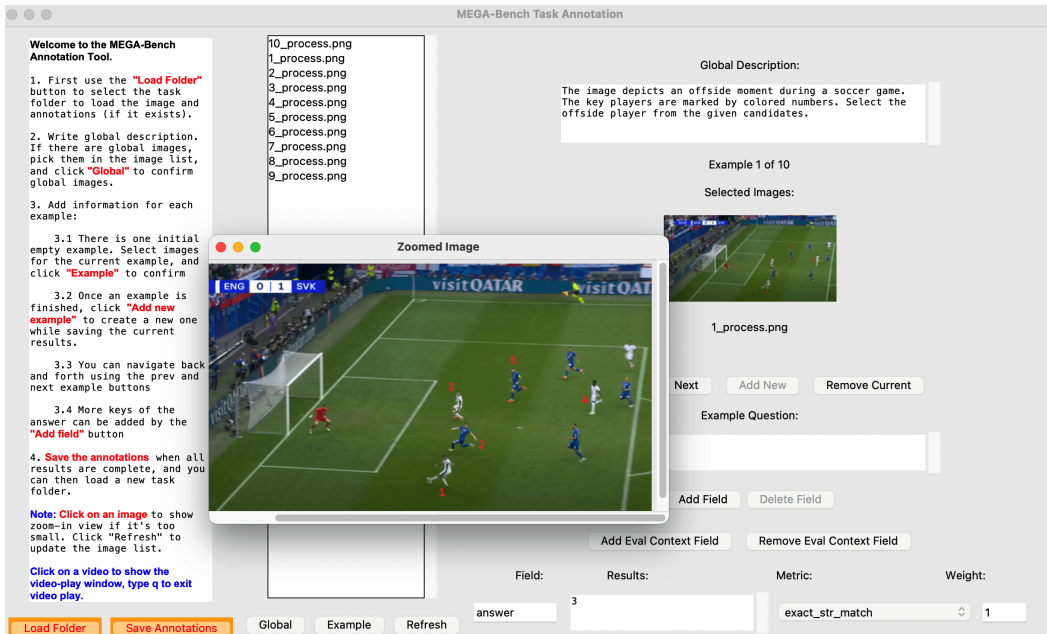

Figure 9: A screenshot of our GUI annotation tool.

(2). The task is inspired by existing benchmarks or datasets. The annotator collects the raw image/video data from existing datasets but does not use the original annotation. The annotator re-designs/repurposes the data by writing concrete task descriptions and creating new questions and answers, or using scripts to re-process the data for the designed task.

(3). The task is directly converted from existing benchmarks or datasets. The annotator randomly samples a subset from the existing benchmark, directly using its image/video and the annotation without redesign.

In our annotation process, the first two task types are encouraged. The task reviewers strictly control the number of the third type and reject the task if an annotator submits many tasks of the third type. Table 18 shows the detailed data source of all tasks in MEGA-BENCH.

Output format and answer uniqueness. We aim to cover diverse output formats in MEGA-BENCH. Therefore, we always require the task annotators to consider adapting the original dataset’s answer format, especially avoiding unnecessary multiple-choice questions (many MCQs are unnatural and mainly for evaluation convenience). Notably, the annotator must provide sufficient context in the task description and per-example question so that the range of the correct answer is manageable and the task can be evaluated with a clearly defined metric.

Metric specification. When creating a task, the annotator must specify the corresponding evaluation metric. Since the metric implementation is in parallel to the task construction process, as described in §3.2, our GUI annotation tool (Figure 9) allows annotators to choose from existing metrics for each answer field of the task and assigns different weights to each field. When the desired metric is unavailable, the annotator chooses an “unsupported” metric type and writes down detailed metric specifications in the pull request. Our core contributors periodically check the needs of new metrics and implement them.

Documentation. When submitting the pull request, the annotator must write README documentation for each task. If the desired metric has not been implemented, the documentation should contain the specification described in the last point. Furthermore, the doc should record the data source (e.g., the Web, an existing dataset, etc.) and brief descriptions of the task. These descriptions are instrumental in helping the core contributors assign various keywords to the task and creating Table 18 to show the details of all tasks.

B.3 TOOLS FOR COORDINATING ANNOTATION AND QUALITY CONTROL

As described in §3.1, we have two additional tools for coordinating the annotation process and maintaining the data. We present the details in this subsection.

The GitHub repository for task organization. We created a private GitHub repository for constructing MEGA-BENCH. The repository’s main branch is protected, and all task submissions must go through pull requests (PRs). The core contributors serve as the task reviewers and discuss with task annotators in the pull request forum to ensure the task conforms to our data collection guidelines (§B.2). The code of our evaluation pipeline, including the model query and score computation, is maintained in the same repository. The core contributors submit pull requests to support different VLMs and add new evaluation metrics, and these PRs are cross-reviewed by other core contributors.

We also actively use the repository’s Issues forum to report bugs in annotation or metric implementation so the corresponding contributors can get notified and work on the fix. At the end of the annotation process, our repository has 685 pull requests and 40 issues. 277 out of the 685 PRs are for task submission, indicating that many annotators submit task groups with more than one task in each PR. Other PRs are mainly for the evaluation pipeline and bug fixing.

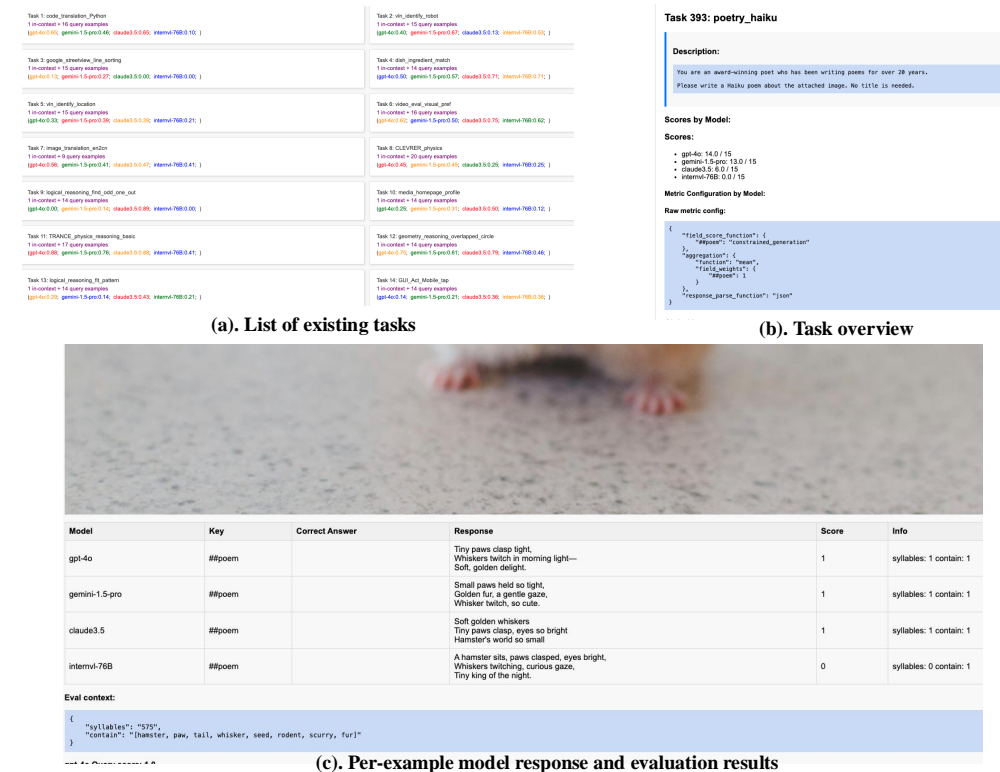

Figure 10: Illustrations of our task visualization page.

Task visualization web page. We developed a simple visualization web page and periodically synchronized the evaluation results of existing tasks on the page. The page provides several benefits: 1) it allows the core contributors to keep track of the overall annotation process, 2) it helps the annotators understand the capability of state-of-the-art VLMs, so that they can adjust the task difficulty accordingly, and 3) it facilitates the checking of the potential annotation glitches or metric bugs, significantly improving the overall quality of MEGA-BENCH. Figure 10 shows screenshots of the visualization page taken during the benchmark construction process. Note that the task names in the figure might not align with the final names in the paper. In our project page, we will provide a similar visualization page for users to interactively inspect the behaviors of different VLMs.

C TAXONOMY TREE AND MULTI-DIMENSIONAL KEYWORDS

This section presents the full details of our application-based taxonomy tree and the multi-dimensional keywords.

C.1 DETAILS OF THE TAXONOMY STRUCTURE

Table 4 shows the detailed structure of our application-driven task taxonomy. The first level defines the broad scope of use cases. At the second level, tasks are categorized into more specific domains. These first two levels guide the annotation process of our benchmark and are gradually updated/refined in the annotation process. The third level lists the concrete names of tasks or task groups. If the third-level node is a task group, the number of concrete tasks under this group is shown in the parenthesis.

Table 4: Details of taxonomy of MEGA-BENCH.

Level-2 Tasks	Leaf Tasks (at Level-3 or deeper)	# Tasks
Coding		
Code Debugging	Stackoverflow Debug Qa, Code Error Line Identification	2
Code Generation	Document Conversion (8 tasks), Programming Problems (4 tasks), Visualization With Code	13
Code Translation	Code Translation Easy, Code Translation Python, Code Translation Hard, Code Translation Advanced	4
Code Understanding	Symbolic Graphics Programming (2 tasks), Webpage Code Understanding, Code Add Tag, Code Match (5 tasks), Code Output (3 tasks)	12
Information Extraction		
App Function Understanding	App Layout Understanding Leetcode, App Layout Understanding Youtube, App Layout Understanding Amazon, App Layout Understanding Word, App Layout Understanding Notes, App Layout Understanding Ppt, App Layout Understanding Alipay, App Layout Understanding Instagram, App Layout Understanding Zoom, App Layout Understanding Excel, App Layout Understanding Iphone Settings, App Layout Understanding Tiktok, App Layout Understanding Twitter	13
Compound Search and Calculate	Cheapest Flight Identification, Weather Info Retrieval, Stock Info Retrieval, Game Platform Support Identification, Top Rated Hotel Identification, Movie Info Retrieval, Top Video Creator Identification, Highest Discount Game Price Identification, Newspaper Page Parse And Count, Remaining Playback Time Calculation	10
Detailed Manual Understanding	Multi Lingual Manual Explanation Scooter Spanish, Multi Lingual Manual Explanation Scooter Arabic, Multi Lingual Manual Explanation Scooter French, Multi Lingual Manual Explanation Scooter Chinese, Multi Lingual Manual Explanation Scooter Russian	5
Multimodal QA	Multilingual News Qa, Product Ocr Qa, Large Image (3 tasks), Gui Chat (2 tasks), Realworld Qa En2cn, Star Object Interaction Video, Video Qa (7 tasks)	16

C.2 STATISTICS OF EACH KEYWORD DIMENSION

Figure 2 of the main paper presented the overall keyword distribution. As a complement, Table 5 provides more detailed statistics. Each of the five dimensions contains multiple keywords, and for each keyword, we explicitly show the number of related tasks and the total number of samples.

Table 5: Number of tasks and samples across the five dimensions, with detailed breakdown into each keyword.

Dimension	Keywords (number of tasks, num of samples)
Skills	Object Recognition (303, 4755), OCR (137, 2239), Language Parsing & Gen. (154, 2509), Scene & Event Understanding (154, 2467), Math & Logical Reasoning (109, 1910), Common-sense & Social Reasoning (51, 855), Ethical & Safety Reasoning (15, 245), Domain-Specific Knowledge/Skills (77, 1387), Spatial & Temporal Reasoning (152, 2437), Planning & Decision Making (37, 577)
Input Format	User Interface (93, 1517), Text-rich Image & Doc (82, 1294), Diagrams & Visualizations (101, 1718), Videos (43, 698), Artistic & Creative (32, 542), Photographs (143, 2248), 3D Related (11, 169)
Output Format	Contextual Formatted (98, 1514), Structured (110, 1714), Exact (83, 1279), Numerical (49, 862), Open-ended (80, 1454), Multiple Choice (85, 1363)
Input Number	6-8 images (21, 314), 9-image+ (41, 623), 1-image (315, 5228), Video (43, 698), 4-5 images (34, 520), 2-3 images (51, 802)
Application	Information_Extraction (72, 1124), Planning (78, 1239), Coding (31, 474), Perception (145, 2313), Metrics (20, 309), Science (29, 574), Knowledge (97, 1605), Mathematics (33, 547)

D EVALUATION DETAILS

This section details our evaluation settings, including the prompt template design, model query details, and evaluation metrics.

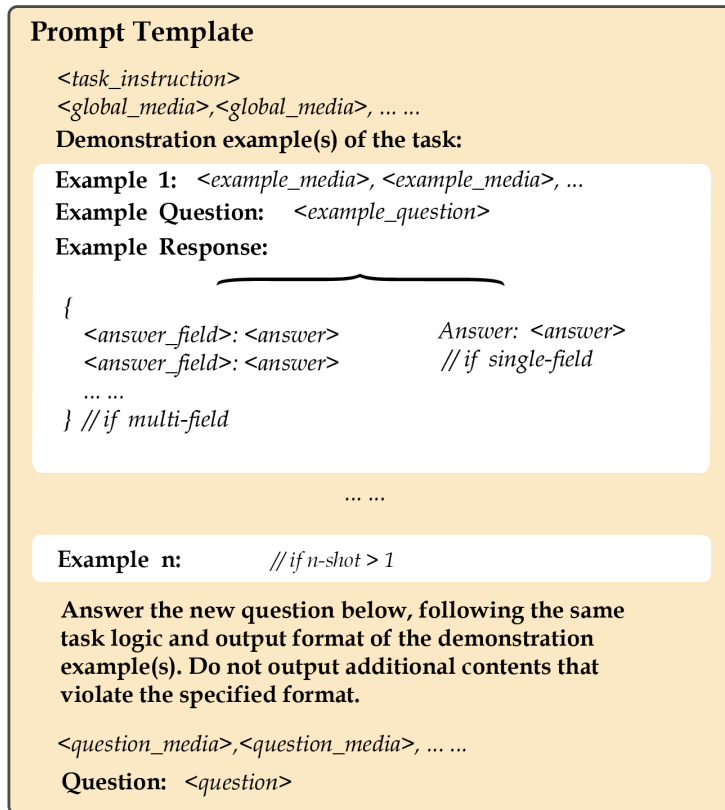

Figure 11: The prompt template structure without Chain-of-Thought (CoT).

D.1 PROMPT TEMPLATE

We provide the concrete prompt template in Figure 11 and Figure 12. All the information organized by the prompt template is serialized by our evaluation pipeline before sending queries to the evaluated model.

The non-CoT prompt instructs the VLM to strictly follow the one-shot example, directly producing the answer without additional text. In contrast, the CoT prompt instructs the VLM to output step-by-step reasoning before providing the final answer, and the model must strictly separate the reasoning process from the final answer.

Note that our prompt sets different formats for single-field and multi-field outputs. Single-field answers must be explicitly indicated by the “Answer: ...” format so that our output parser can robustly locate and extract the model’s answer. Multi-field answers are in JSON format, and our JSON parser can robustly extract the JSON-style answer from the entire response without the “Answer: ...” format.

D.2 MODEL QUERY DETAILS

Since the evaluated VLMs have different context windows, we must tailor the number of query images or video frames for each model. We implement an image/video pre-processing pipeline that follows the settings listed in Table 6 to sub-sample the input images and videos. We allocate different budgets for in-context examples and the query. Since the in-context examples (we use a

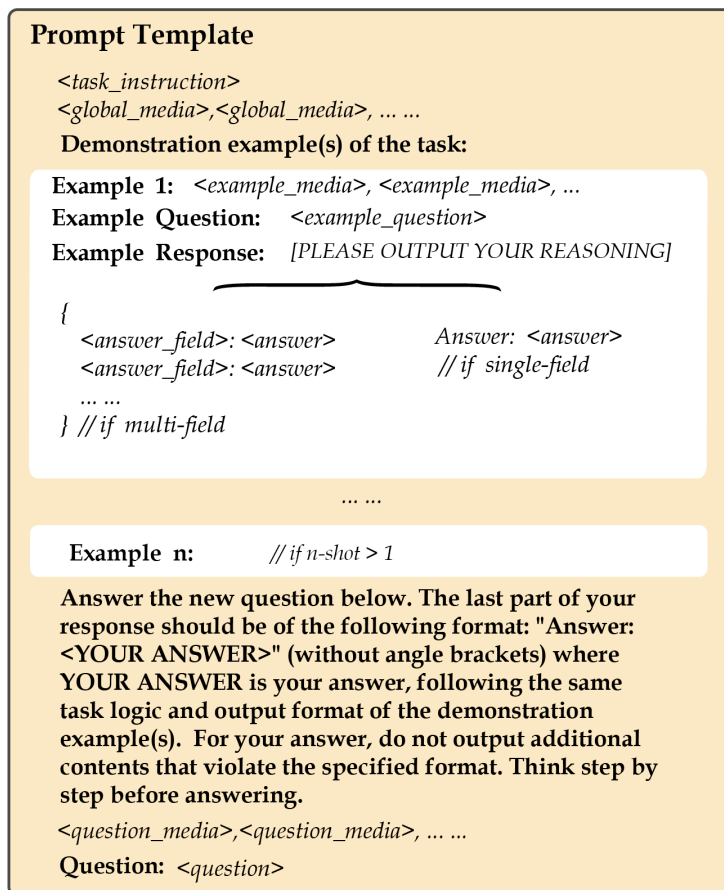

Figure 12: The prompt template structure for the Chain-of-Thought (CoT) setting

one-shot example) mainly help models understand the task logic and the output format, we reserve most of the image budget for the query. Images or video frames surpassing the budget are discarded. To make sure the open-source models can run smoothly, we implement a fallback strategy, which reduces the image budget to decrease the number of input tokens if the model’s maximum context length is exceeded.

For images or video frames with a longer side larger than 1000 pixels, we resize the longer side to 1000 without changing the aspect ratio before sending them to the evaluated model. Each

D.3 LLM-ASSISTED METRICS

The LLM-assisted metric instructs a multimodal LLM to evaluate VLM’s response by providing a detailed evaluation prompt. When submitting a task with open-ended answers that cannot be evaluated by rule-based metrics, the annotator is asked to write down a detailed evaluation prompt for the LLM judge following the prompt format in Figure 13.

Concretely, the task annotator decides if the LLM judge should consider the question’s visual input when evaluating the model’s response. If yes, then the query media (images or videos) will be passed to the LLM as well (we use GPT-4o-0806 as a multimodal judge model). For most tasks, the LLM judge can do a proper evaluation by comparing the model’s response with the reference answer, and the visual media is not needed. The task annotator also writes a thorough evaluation criteria, explaining to the judge model the meaning of each score range, which is important to get reliable evaluation results.

Table 6: The maximum number of images and the budget for the in-context example per model.

Model	Max # of images	In-context example budget

LLM-Assisted Metrics Prompt Template

```

<media>,<media>, ... .. // if judge with image
<evaluation_criteria> // defined by task annotator
Reference: <reference_answer>
Model Response: <model_response>
(Optional): <per_example_label>
                // some tasks require per-example criteria
Please output your score in the following format:
**Score**: <single_number>,
**Score explanation**: <detailed_explanations>

```

Figure 13: The prompt template structure for LLM-Assisted Metrics

At the end of the prompt, a pre-defined scoring format instruction is attached, ensuring the judge model outputs a score between 1 and 10 and an explanation for the score.

D.4 RULE-BASED METRICS

We have over 40 highly customized rule-based metrics to evaluate the Core set of MEGA-BENCH. Basic metrics like “extract string match” and “simple string match” (which ignores punctuation and special characters) are first added to the supported metric set. New metrics are implemented when our task annotators submit new tasks requiring uncovered metrics. In the end, we get 45 customized tasks, as shown in Table 7. The usage distribution is long-tail because many metric implementations are triggered by a single novel task.

Table 7: All metrics used in MEGA-BENCH.

Metric Name	Usage Count (# tasks)
Exact String Match	198
GPT-4o as Judge	64
Simple String Match	61

D.5 ANSWER EXTRACTION FROM MODEL RESPONSE

For Core tasks, our rule-based evaluation metrics compare the model’s answer with a ground-truth answer or some ground-truth constraints. Therefore, an answer extraction step is necessary to separate the final answer from the reasoning process and other irrelevant texts. We implement robust extraction logic for different types of outputs based on the format specified in the prompt template:

Single-field answer. We first reduce the answer by the “Answer: ...” pattern. If this pattern does not exist, we take the entire response. Since many VLMs do not strictly follow the format instructions, we have specific and extra processing for different output formats to improve robustness. Some typical examples are: 1) For multiple-choice outputs, we locate the exact letter or index choice using sophisticated regular expressions, which excludes any potential parenthesis or accompanying texts; 2) For code outputs, we extract the code from the potential code blocks; 3) For structured

outputs, we parse the structural data into the proper Python data structures (list, set, dictionary, etc.), with tolerance on minor syntax errors (e.g., we automatically fix wrong quotes).

Multi-field answer. Since the prompt requires the model to output the final answer in JSON format, we implement a robust JSON parser to locate the JSON structure in the raw response and convert the JSON structure into the corresponding Python data structure.

If our comprehensive answer extraction fails to obtain any meaningful final answer from the model response, we consider the model as “fail to follow instructions”.

E COMPLETE MULTI-DIMENSIONAL BREAKDOWN RESULTS

This section provides the full breakdown results over the five dimensions of MEGA-BENCH, complementing [section 4](#) of the main paper.

E.1 BREAKDOWN RESULTS ON THE SKILL DIMENSION

Table 8: Average scores for each model on the *skill* dimension. The best-performing model in each category is **in-bold**, and the second best is underlined.

Model	CASR	DKAS	EASR	LUAG	MALR	ORAC	PADM	SAEU	SATR	TR
Claude-3.5-Sonnet (1022) (Anthropic, 2024b)	59.1	<u>54.9</u>	65.7	60.8	48.9	56.9	29.1	55.1	43.2	62.2

F DETAILED INSPECTION OF MODEL BEHAVIOURS ON MEGA-BENCH

To complement §4.3 of the main paper, this section presents a case study analysis of the error types of different models on different tasks in MEGA-BENCH. We use similar error categories as in MMMU (Yue et al., 2024a) and MMT-Bench (Ying et al., 2024):

- **Perception Error:** VLMs fail to recognize or perceive the content of interest in the query image(s). Perception errors indicate the
- **Lack of Knowledge:** VLMs lack the domain-specific knowledge to answer specialized questions, such as identifying the taxonomic order of an insect.
- **Lack of (Reasoning) Capability:** VLMs lack the necessary capabilities to solve the task, mainly related to various reasoning abilities, such as logical reasoning, counting, spatial or temporal reasoning, symbolic reasoning for code or various programs, and so on. This is a broad type that covers many errors. One typical case for this error type is that the models can accurately follow instructions and perceive the visual inputs but struggle with the required reasoning process, leading to incorrect answers.
- **Refuse to Answer:** VLMs refuse to answer questions that they believe to involve sensitive content.
- **Fail to Follow Instructions:** VLMs fail to correctly understand instructions and provide wrong answers. The tasks in MEGA-BENCH usually have more instructions on the answer format compared to previous benchmarks. A typical error pattern is not comprehending the required format, thus providing answers with incorrect formats or generating irrelevant responses. This error type is much more common in open-source models.

Figure 14 to Figure 33 shows the case study for samples from different tasks. We use distinct colors to highlight the tags in each task sample. We borrow the error case analysis template from MMMU (Yue et al., 2024a) while adding the keywords information of MEGA-BENCH. We mainly focus on the flagship proprietary models. The Claude-3.5 in these figures refers to the Claude-3.5-Sonnet (0620) model.

List of Figures Depicting Model Behaviors

14	Coding - Code Debugging: Error Case	46
15	Coding - Code Understanding: Error Case 1	47
16	Coding - Code Understanding: Error Case 2	48
17	Information Extraction - Multimodal QA: Error Case	49
18	Information Extraction - Detailed Manual Understanding: Error Case	50
19	Information Extraction - Search by Attribute without Calculate: Error Case	51
20	Knowledge - World Knowledge: Error Case 1	52

27	Planning - Puzzles and Games: Error Case 2	59
28	Planning - Reordering: Error Case	60
29	Perception - Multimodal Constrained Captioning: Error Case	61
30	Perception - Visual Recognition: Error Case 1	62
31	Perception - Visual Recognition: Error Case 2	63
32	Perception - Visual Recognition: Error Case 3	64
33	Science - STEM: Error Case	65

Coding: Code Debugging

Task Name: Code Error Line Identification

Given a piece of program code, identify the most obvious error. Output the line number on the left where the error occurs. Attention: Do not invoke any external compilers or related programs.

Question: Where the error occurs?

Keywords:

Domain-Specific Knowledge and Skills, Text-Based Images and Documents, Mathematical and Logical Reasoning, Multiple Choice

15     TopNum[ V ] = ++ Counter;
16     for (j=0; j<n; j++)
17       if ( a[V][j]!=0)
18         if (Indegree[--j] == 0 ) S[++top]=j;
19   }
20   if ( Counter!=n ) printf( "Graph has a cycle" );
21 }

```

Claude-3.5: 1. The function declaration and variable initializations seem correct. 2. The first nested loop (lines 7-12) appears to be properly structured. 3. The while loop (lines 13-19) also seems structurally correct. 4. However, within this while loop, there's an issue on line 18: 5. This error is the most obvious and significant in the code, as it will likely cause runtime errors or incorrect results. Therefore, the most obvious error occurs on line 18.

Answer: 18 (score: 1.0)

Error Category: Lack of Capability

GPT-4o: The most obvious error in the code is the use of `printf` instead of `printf` in line 20. The correct function name should be `printf`.

Answer: 20 (score: 0.0)

Correct Answer: 18

Coding: Code_Understanding

Task Name: Code Output Result

Given several images of program code, output the program's execution result. Attention: Do not invoke any external compilers or related programs. Place the code output in a Markdown result code block.

Question: What's the output of the program?

Keywords:

OCR, Mathematical and Logical Reasoning
Domain-Specific Knowledge, Text-Based Images and Documents

```
use std::sync::{Arc, Mutex};
use std::thread;

fn main() {
    let data = Arc::new(Mutex::new(vec![1, 2, 3]));
    let mut handles = vec![];

    for i in 0..3 {
        let data_clone = Arc::clone(&data);
        let handle = thread::spawn(move || {
            let mut vec = data_clone.lock().unwrap();
            vec[0] += 1;
        });
        handles.push(handle);
    }

    for handle in handles {
        handle.join().unwrap();
    }

    println!("Final data: {:?}", #data.lock().unwrap());
}
```

Error Category: Lack of Capability

Claude 3.5: Let's analyze this Rust code step by step:

1. We start with a vector [1, 2, 3] wrapped in an Arc<Mutex<...>>.
2. We create an empty vector `handles` to store thread handles.
3. We spawn 3 threads (for i in 0..3):
 - Each thread gets a clone of the Arc.
 - Each thread locks the mutex and increments the first element of the vector.
4. After spawning, we join all threads, ensuring they complete.
5. Finally, we print the contents of the vector.

Let's trace the changes:

- Initial state: [1, 2, 3]
- Thread 1: [2, 2, 3]
- Thread 2: [3, 2, 3]
- Thread 3: [4, 2, 3]

The final state of the vector will be [4, 2, 3]. The println! macro will output this vector.

Answer: Final data: [4, 2, 3] (score: 0.0)

Correct Answer: Final data: [1, 3, 5]

Task Name	Source Description	Output Format	Metrics
Places365 Similar Scene Retrieval	Images and labels were taken from the Places365 dataset (Zhou et al., 2017) and adapted into questions and answers by a human annotator.	MC	Exact String Match
Booking Web Recommendation	Images and labels come from the SEED-Bench (Li et al., 2024b) dataset. Some images are from Yelp . Questions and annotations were adapted by a human annotator.	Contextual	Jaccard Index Case Insensitive
Game Info Retrieval	Screenshots were taken by the human annotator on the Epic Games Store . Questions and answers were created by the annotator.	Contextual	String Set Equality Comma
Media Homepage Profile	Most images and labels come from the SEED-Bench (Li et al., 2024b) dataset, while one came from a screenshot taken by a human annotator. Questions and annotations were adapted by a human annotator.	Structured	Jaccard Index Case Insensitive
Movie Retrieval By Actor	Screenshots were taken by the human annotator on the Amazon Prime Video webpage . Questions and answers were created by the annotator.	Contextual	String Set Equality Comma
Music Info Retrieval	Screenshots were taken by the human annotator on the Spotify Web Player . Questions and answers were created by the annotator.	Contextual	String Set Equality Comma
Tv Show Retrieval By Character	Screenshots were taken by the human annotator on the Amazon Prime Video webpage . Questions and answers were created by the annotator.	Contextual	String Set Equality Comma
App Layout Understanding Leetcode	Screenshots were taken by the human annotator on Leetcode . Questions and answers were created by the annotator.	Exact	Exact String Match
App Layout Understanding Youtube	Screenshots were taken by the human annotator on YouTube . Questions and answers were created by the annotator.	Exact	Exact String Match
App Layout Understanding Amazon	Screenshots were taken by the human annotator on Amazon . Questions and answers were created by the annotator.	Exact	Exact String Match

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
App Layout Understanding Word	Screenshots were taken by the human annotator on Microsoft Word. Questions and answers were created by the annotator.	Exact	Exact String Match
App Layout Understanding Notes	Screenshots were taken by the human annotator on the Google Notes app. Questions and answers were created by the annotator.	Exact	Exact Str Match Case Insensitive
App Layout Understanding Ppt	Screenshots were taken by the human annotator on Microsoft PowerPoint. Questions and answers were created by the annotator.	Exact	Exact String Match
App Layout Understanding Alipay	Screenshots were taken by the human annotator on the Alipay app. Questions and answers were created by the annotator.	Exact	Exact String Match
App Layout Understanding Instagram	Screenshots were taken by the human annotator on the Instagram app. Questions and answers were created by the annotator.	Exact	Exact String Match
App Layout Understanding Zoom	Screenshots were taken by the human annotator on Zoom. Questions and answers were created by the annotator.	Exact	Exact String Match
App Layout Understanding Excel	Screenshots were taken by the human annotator on Microsoft Excel. Questions and answers were created by the annotator.	Exact	Exact String Match
App Layout Understanding Iphone Settings	Screenshots were taken by the human annotator on the iPhone. Questions and answers were created by the annotator.	Exact	Exact String Match
App Layout Understanding Tiktok	Screenshots were taken by the human annotator on the TikTok app. Questions and answers were created by the annotator.	Exact	Exact String Match
App Layout Understanding Twitter	Screenshots were taken by the human annotator on the X (formerly Twitter) app. Questions and answers were created by the annotator.	Exact	Exact String Match
Multilingual News Qa	Screenshots were taken by the human annotator on X (formerly Twitter). Questions and answers were created by the annotator.	Contextual	Multi Ref Phrase

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Product Ocr Qa	Images were taken from various websites. Questions and answers were created by the annotator.	Exact	Exact String Match
Research Website Parsing Blogpost	Screenshots were taken of various ML research websites. Questions and answers were created by the annotator.	Contextual	Multi Ref Phrase
Research Website Parsing Homepage	Screenshots were taken of various ML research websites. Questions and answers were created by the annotator.	Contextual	Multi Ref Phrase
Research Website Parsing Publication	Screenshots were taken of various ML research websites. Questions and answers were created by the annotator.	Contextual	Multi Ref Phrase
Gui Chat Easy	Images and annotations were adapted from the GUI Chat dataset (Chen et al., 2024c) by the human annotator into an open-ended question.	Open	GPT-4o as Judge
Gui Chat Hard	Images and annotations were adapted from the GUI Chat dataset (Chen et al., 2024c) by the human annotator into an open-ended question.	Open	GPT-4o as Judge
Realworld Qa En2cn	Images and annotations were adapted from the RealWorldQA benchmark (xAI, 2024) by the human annotator into an open-ended question. The translation requirement was added by the human annotator.	Contextual	Multi Ref Phrase
Star Object Interaction Video	Videos and annotations were adapted from the STAR benchmark (Wu et al., 2024) by the human annotator into questions and answers.	Contextual	Multi Ref Phrase
Funqa Unexpected Action Magic Video	Videos and annotations were adapted from the FunQA benchmark (Xie et al., 2023) by the human annotator into being an open-ended question.	Open	GPT-4o as Judge
Activitynetqa	Images and annotations were adapted from the ActivityNetQA benchmark (Yu et al., 2019) by the human annotator into being an open-ended question.	Open	GPT-4o as Judge

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Funqa Unex- pected Action Creative Video	Videos and annotations were adapted from the FunQA benchmark (Xie et al., 2023) by the human annotator into being an open-ended question.	Open	GPT-4o as Judge
Nextqa Mc	Images and annotations were adapted from the NExTQA benchmark (Xiao et al., 2021) by the human annotator into questions and answers.	MC	Exact String Match
Video Qa	Videos taken from YouTube . Questions and answers created by human annotator.	Open	GPT-4o as Judge
Nextqa Oe	Images and annotations were adapted from the NExTQA benchmark (Xiao et al., 2021) by the human annotator into being an open-ended question.	Open	GPT-4o as Judge
Funqa Unex- pected Action Humor Video	Videos and annotations were adapted from the FunQA benchmark (Xie et al., 2023) by the human annotator into being an open-ended question.	Open	GPT-4o as Judge
Multilingual Movie Info Parsing	Screenshots were taken by the human annotator on the Amazon Prime Video webpage . Questions and answers were created by the annotator.	Structured	Exact String Match, Simple String Match
Movie Info Pars- ing	Screenshots were taken by the human annotator on the Amazon Prime Video webpage . Questions and answers were created by the annotator.	Structured	Exact String Match
Stock Info Parsing	Screenshots were taken by the human annotator on Yahoo Finance . Questions and answers were created by the annotator.	Structured	Exact String Match
Music Info Pars- ing	Screenshots were taken by the human annotator on the Spotify Web Player . Questions and answers were created by the annotator.	Structured	Exact String Match
Multilingual Game Info Pars- ing	Screenshots were taken by the human annotator on the Epic Games Store . Questions and answers were created by the annotator.	Structured	Exact String Match
Ocr Article Au- thors	Screenshots taken of various academic papers. Questions and answers created by human annotator.	Structured	Simple String Match

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Youtube Video Info Parsing	Videos taken from YouTube . Questions and answers created by human annotator.	Structured	Exact Match String
Tv Show Info Parsing	Screenshots were taken by the human annotator on the Amazon Prime Video webpage . Questions and answers were created by the annotator.	Structured	Simple Match String
Ocr Resume School Plain	Resumes taken from various personal websites. Questions and answers were created by the annotator.	Contextual	String Set Equality Line Break
Image Translation En2cn	Images were collected from various sources, including academic papers, news articles, shopping receipts, etc. The annotations are obtained by GPT-4o translation followed by a human check.	Contextual	Gleu Cn
Booking Web Rating	Images and labels come from the SEED-Bench (Li et al., 2024b) dataset. Some images are from Yelp . Questions and annotations were adapted by a human annotator.	Structured	Exact Match String
Weather Info Parsing	Images were collected from the Microsoft Weather by taking screenshots. Questions and answers were designed by the annotator.	Structured	Exact Match String
Game Info Parsing	Screenshots were taken by the human annotator on the Epic Games Store . Questions and answers were created by the annotator.	Structured	Exact Match String
Weather Map Climate Type Temperature Parsing	One of the examples comes from the SEED-Bench 2 Plus benchmark (Li et al., 2024b). The rest of the images were collected from various online websites. Questions and annotations were adapted by a human annotator.	Structured	Exact Match String
Hotel Booking Confirmation Parsing	Screenshots were taken by the human annotator on Booking.com . Questions and answers were created by the annotator.	Structured	Exact Match String

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Entertainment Web Game Style	Some of the examples come from the SEED-Bench 2 Plus benchmark (Li et al., 2024b). The rest of the screenshots were taken on the Steam store . Questions and annotations were adapted by a human annotator.	Structured	Exact Str Match Case Insensitive, Exact String Match
Planning			
Wikihow Complex Task Completion	Data collected from website, and the questions and answers are designed by human annotator	Open	GPT-4o as Judge
Vln Identify Robot	Data collected from RxR dataset (Ku et al., 2020), the question and answer are adapted to select the robot that should execute the instruction	Exact	Exact String Match
Vln English Next Step	Data collected from RxR dataset (Ku et al., 2020), the question and answer are adapted by human annotator	Contextual	Simple String Match
Vlnqa Egocentric Navigation Video	Data collected from VLN-CE (Krantz et al., 2020) and the task is adapted from MVBench (Li et al., 2024e), the question and answer are adapted by human annotator	Contextual	Simple String Match
Vln Identify Location	Data collected from RxR dataset (Ku et al., 2020), the question and answer are adapted by human annotator	Structured	Exact String Match
Vln Tegulu Next Step	Data collected from RxR dataset (Ku et al., 2020), the question and answer are adapted by human annotator	Structured	Simple String Match
Vln Hindi Next Step	Data collected from RxR dataset (Ku et al., 2020), the question and answer are adapted by human annotator	Contextual	Simple String Match
App Interactive Operations Instagram	Data collected from application screenshots by human annotator, and the questions and answers are designed by human annotator	MC	Exact String Match
App Interactive Operations Leetcode	Data collected from application screenshots by human annotator, and the questions and answers are designed by human annotator	MC	Exact String Match

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Gui Act Web Multi	Data collected from webpage screenshots by human annotator, and the questions and answers bounding boxes are annotated by human annotator	Structured	Exact Match, String Nbbox Iou Xml Single
App Interactive Operations Ppt	Data collected from application screenshots by human annotator, and the questions and answers are designed by human annotator	MC	Exact Match String
Gui Act Mobile Swipe	Data collected from application screenshots by human annotator, and the questions and answers bounding boxes are annotated by human annotator	Structured	Xml Norm Point Distance
App Interactive Operations Excel	Data collected from application screenshots by human annotator, and the questions and answers are designed by human annotator	MC	Exact Match String
Gui Act Mobile Tap	Data collected from application screenshots by human annotator, and the questions and answers bounding boxes are annotated by human annotator	Numerical	Xml Norm Point In Bbox
App Interactive Operations Alipay	Data collected from application screenshots by human annotator, and the questions and answers are designed by human annotator	MC	Exact Match String
Gui Act Web Single	Data collected from webpage screenshots by human annotator, and the questions and answers bounding boxes are annotated by human annotator	Numerical	Xml Nbbox Iou Single
App Interactive Operations Twitter	Data collected from application screenshots by human annotator, and the questions and answers are designed by human annotator	MC	Exact Match String
App Interactive Operations Word	Data collected from application screenshots by human annotator, and the questions and answers are designed by human annotator	MC	Exact Match String
App Interactive Operations Iphone Settings	Data collected from application screenshots by human annotator, and the questions and answers are designed by human annotator	MC	Exact Match String
App Interactive Operations Tiktok	Data collected from application screenshots by human annotator, and the questions and answers are designed by human annotator	MC	Exact Match String

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
App Interactive Operations Notes	Data collected from application screenshots by human annotator, and the questions and answers are designed by human annotator	MC	Exact Match String
App Interactive Operations Zoom	Data collected from application screenshots by human annotator, and the questions and answers are designed by human annotator	MC	Exact Match String
App Interactive Operations Amazon	Data collected from application screenshots by human annotator, and the questions and answers are designed by human annotator	MC	Exact Match String
Web Action Grounding	Data collected from Visual-WebBench (Liu et al., 2024a), and the questions and answers are adapted by human annotator	MC	Exact Match String
App Interactive Operations Youtube	Data collected from application screenshots by human annotator, and the questions and answers are designed by human annotator	MC	Exact Match String
Calendar Schedule Suggestion	Data collected from Google Calendar by human annotator, and the questions and answers are designed by human annotator to identify all possible starting times for a meeting within a specified time range and duration	Contextual	Set Equality
Planning Visual Barman	Data collected from Planning Domain Definition Language (PDDL) of Barman , and the questions and answers are adapted to match the transitions from init state to goal state	Structured	Symbolic Planning Test
Planning Visual Floortile	Data collected from website, and the questions and answers are adapted to match the transitions from init state to goal state	Structured	Symbolic Planning Test
Planning Visual Storage	Data collected from website, and the questions and answers are adapted to match the transitions from init state to goal state	Structured	Symbolic Planning Test
Planning Screenshot Grippers	Data collected from website, and the questions and answers are adapted to match the transitions from init state to goal state	Structured	Symbolic Planning Test
Planning Visual Blocksworld	Data collected from website, and the questions and answers are adapted to match the transitions from init state to goal state	Structured	Symbolic Planning Test

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Planning Screenshot Barman	Data collected from Planning Domain Definition Language (PDDL) of Barman , and the questions and answers are adapted to match the transitions from init state to goal state	Structured	Symbolic Planning Test
Planning Screenshot Termes	Data collected from website, and the questions and answers are adapted to match the transitions from init state to goal state	Structured	Symbolic Planning Test
Planning Screenshot Floortile	Data collected from website, and the questions and answers are adapted to match the transitions from init state to goal state	Structured	Symbolic Planning Test
Planning Screenshot Blocksworld	Data collected from website, and the questions and answers are adapted to match the transitions from init state to goal state	Structured	Symbolic Planning Test
Planning Screenshot Storage	Data collected from website, and the questions and answers are adapted to match the transitions from init state to goal state	Structured	Symbolic Planning Test
Planning Visual Termes	Data collected from website, and the questions and answers are adapted to match the transitions from init state to goal state	Structured	Symbolic Planning Test
Planning Screenshot Tyreworld	Data collected from website, and the questions and answers are adapted to match the transitions from init state to goal state	Structured	Symbolic Planning Test
Planning Visual Grippers	Data collected from website, and the questions and answers are adapted to match the transitions from init state to goal state	Structured	Symbolic Planning Test
Logical Reasoning Find Odd One Out	Data collected from website , and the questions and answers are adapted to match strings	Structured	Dict Equality, Exact String Match
Logical Reasoning Fit Pattern	Data collected from LogicVista (Xiao et al., 2024) , and the questions and answers are adapted by human annotator	MC	Exact Match String
Perception-Test Object Shuffle Video	Data collected from VLN-CE (Krantz et al., 2020) and the task is adapted from MVBench (Li et al., 2024e) , the question and answer are adapted into single choice by human annotator	MC	Simple Match String

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Chess Puzzles Checkmate	Data collected from Lichess , and the questions and answers are adapted to match strings	Structured	Set Equality
Chess Puzzles Equality	Data collected from Lichess , and the questions and answers are adapted to match strings	Structured	Set Equality
Bridge Strategies Expert	Data and answer are collected from Bridge Master 2000	Open	GPT-4o as Judge
Chess Puzzles Crushing	Data collected from Lichess , and the questions and answers are adapted to match strings	Exact	Exact String Match
Chess Puzzle Single Step	Data collected from Lichess , and the questions and answers are adapted to match strings	Exact	Exact String Match
Chess Find Legal Moves	Data collected from game positions of games in the 2024 FIDE Candidates tournament, and the questions and answers are adapted to match strings	Exact	Chess Move List Jaccard Index, Exact String Match
Bridge Strategies Advanced	Data and answer are collected from Bridge Master 2000	Open	GPT-4o as Judge
Chess Winner Identification	Data collected from IsoBench (Fu et al., 2024b), and the questions and answers are adapted by human annotator	Exact	Exact String Match
Bridge Strategies Worldclass	Data and answer are collected from Bridge Master 2000	Open	GPT-4o as Judge
Mahjong	Data collected from website and screenshot of MajSoul, and the answer are annotated by human annotator	Exact	Exact String Match
Chess Syzygy Endgames	Endgames created by human annotator and data collected from https://syzygy-tables.info , and the questions and answers are adapted to match Jaccard index	Exact	Chess Move List Jaccard Index, Exact String Match
Go Capture Stone	Data collected from https://online-go.com/learn-to-play-go/capture and https://forums.online-go.com/t/capture-go-problems/31531/9 , and the questions and answers are adapted to match strings	Exact	Exact String Match
Bongard Problem	Data collected from https://www.oebp.org/welcome.php and https://www.foundalis.com/res/bps/bpidx.htm	Contextual	String Set Equality Comma

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Number Puzzle Kakuro 5x5	Data collected from https://krazydad.com/kakuro/ , and the questions and answers are adapted to match strings	Exact	Exact String Match
Mensa Iq Test	Data collected from website, and the questions and answers are adapted to match dict equality	Structured	Dict Equality
Arc Agi	Data collected from https://arcprize.org/play and the task is adapted from Intelligence (Chollet, 2019), the question and answer are adapted into a grid of digits by human annotator	Exact	Exact String Match
Mnist Pattern	Data collected from MNIST (Deng, 2012), and the questions and answers are adapted to match strings	Numerical	Exact String Match
Number Puzzle Sudoku	Data collected from puzzles.ca , and the questions and answers are adapted to match strings	Contextual	Simple String Match
Move Pos To Pos Hanoi 4 Pole	Shortest paths derived from a diagram found on website and the questions and answers are created to match strings and the longest common move prefix	Structured	Exact String Match, Longest Common List Prefix Ratio
Pictionary Car- toon Drawing Guess	Data collected from An early evaluation of gpt-4v (ision) (Wu et al., 2023), the question and answer are adapted to match strings by human annotator	Exact	Exact Str Match Case Insensitive
Pictionary Chi- nese Food Img2en	Data collected from website, and the questions and answers are adapted to match strings	Exact	Exact Str Match Case Insensitive
Pictionary Doodle Guess	Data collected from website , and the questions and answers are adapted to match strings	Exact	Exact String Match
Pictionary Skribbl Io	Data collected from screenshots collected by human annotator on skribbl.io and the questions and answers are adapted to match strings	Exact	Exact Str Match Case Insensitive
Pictionary Genai Output Chinese	Data collected from screenshot of website, and the questions and answers are adapted to match strings	Exact	Exact String Match
Annoying Word Search	Data collected from various websites, and the answers are annotated by human annotator	Contextual	Dict Jaccard Agg Jaccard

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Logical Reasoning 2d Views Of 3d Shapes	Data collected from website, and the questions and answers are adapted to match strings	Structured	Dict Equality
Maze 2d 8x8	Data generated from https://www.mazegenerator.net/ , and the questions and answers are adapted to match strings	Exact	Exact Str Match Case Insensitive
Crossword Mini 5x5	Data collected from website, and the questions and answers are adapted to match strings	Structured	Dict Exact Str Match Agg Recall
Rebus	Data collected from website, and the questions and answers are adapted to match strings	Contextual	Simple String Match
Icon Arithmetic Puzzle	Data collected from An early evaluation of gpt-4v (ision) (Wu et al., 2023), the question and answer are adapted to match strings by human annotator	Structured	Exact String Match, Sequence Equality
Iq Test Open Ended	Data and answers are collected from website	Open	GPT-4o as Judge
Ball Cup Swap 3	Screenshots taken from video and edited together using images found online, and the questions and answers are adapted to match strings	MC	Exact String Match
Logical Reasoning 2d Folding	Data collected from website, and the questions and answers are adapted to match strings	MC	Exact String Match
Perception Test Video Character Order	Data collected from Perception Test (Patraucean et al., 2024) and the task is adapted from MVBench (Li et al., 2024e), the question and answer are adapted into single answer string by human annotator	Contextual	Simple String Match
Comic Page Ordering	Data collected from website	Contextual	Sequence Equality
Recipe Image Ordering	Data collected from website	MC	Sequence Equality
Coding			
Code Translation Easy	Data and test cases are collected from Pintia	Structured	Program Judge
Code Translation Python	Data collected from xCodeEval split (Khan et al., 2023), and test cases are annotated by human	Structured	Program Judge
Code Translation Hard	Data and test cases are collected from Pintia	Structured	Program Judge

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Code Translation Advanced	Data and test cases are collected from Pintia	Structured	Program Judge
Symbolic Graphics Programs Computer Aided Design	Data and answer are collected from SGP-Bench (Qiu et al., 2024)	Contextual	Multi Ref Phrase
Symbolic Graphics Programs Scalable Vector Graphics	Data and answer are collected from SGP-Bench (Qiu et al., 2024)	Contextual	Multi Ref Phrase
Webpage Code Understanding	Data are collected from website, and the question and answer are adapted for string match	MC	Exact String Match
Code Add Tag	Data collected from xCodeEval (Khan et al., 2023), the question and answer are adapted to match code tag	Contextual	Set Equality
Media Recommend Solutions Stackoverflow	Data are collected from Stack Overflow Website, and the question and answer are adapted to match string	MC	Exact String Match
Flowchart Code Generation	Data are collected from website, and the question and answer are designed by human annotator	MC	Exact String Match
Code Solution Compare	Data collected from SGP-Bench (Qiu et al., 2024), and the question and answer are adapted for string match	Exact	Exact String Match
Code Match Problem	Data collected from SGP-Bench (Qiu et al., 2024), and the question and answer are adapted to match code	Exact	Exact String Match
Code Visualization Output Understanding	Data are collected from website, and the question and answer are designed by human annotator	MC	String Set Equality Comma
Code Output Result	Data are collected from San-Foundry MCQs , and the question and answer are designed by human annotator	Exact	Code Result Exact Str Match
Code Execution	Data collected from execution-v2 (Jain et al., 2024a), the question and answer are adapted to match string	Contextual	Simple String Match
Code Retrieval	Data collected from SGP-Bench (Qiu et al., 2024), and the question and answer are adapted to match string	Exact	Exact String Match

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Table2latex Complex	Data collected from SGP-Bench (Qiu et al., 2024), and the question and answer are adapted for LLM Judge	Structured	GPT-4o as Judge
Ocr Table To Html	Data are collected from website, and the question and answer are designed by human annotator	Structured	Simple String Match
Ocr Table To Markdown	Data are collected from website, and the question and answer are designed by human annotator	Structured	Simple String Match
Ocr Math Text LaTeX	Data are collected from website, and the question and answer are designed by human annotator to match text with \LaTeX	Contextual	Text With Latex Expr Equality
Ocr Math Equation	Data are collected from website, and the question and answer are designed by human annotator to match \LaTeX	Contextual	Latex Expr Equality
Latex Complex Formula Conversion	Data are collected from latex-formulas and TexTeller , and the question and answer are designed by human annotator	Structured	Latex Expr Equality
Ocr Table To LaTeX	Data are collected from website, and the question and answer are designed by human annotator	Structured	Simple String Match
Ocr Table To Csv	Data are collected from website, and the question and answer are designed by human annotator	Structured	Simple String Match
Code Programming Test Easy	Data and test cases are collected from Pintia	Structured	Program Judge
Code Programming Test Hard	Data and test cases are collected from Pintia	Structured	Program Judge
Code Programming Test Advanced	Data and test cases are collected from Pintia	Structured	Program Judge
Code Programming Extremely Hard	Data and test cases are collected from Pintia	Structured	Program Judge
Visualization With Code	Data are collected from website, and the question and answer are designed by human annotator	Structured	GPT-4o as Judge
Stackoverflow Debug Qa	Data are collected from Stack Overflow Website, and the question and answer are adapted to match string	Structured	Exact Str Match Case Insensitive, Exact String Match
Code Error Line Identification	Data collected from Pintia , and the question and answer are adapted to match string	MC	Exact String Match

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Perception			
Visual Correspondence In Two Images	Images are from BLINK (Fu et al., 2024c). Annotator manually added one more reference point per sample and designed structured answers	Structured	Dict Equality
2D Image Jigsaw Puzzle Easy	Images created by playing the online Jigsaw simulator and taking screenshots	Structured	Dict Match Exact Str Agg Recall
Adapted Cvbench Distance	Data collected from CV-Bench’s distance split (Tong et al., 2024), and adapted into exact text answer	Exact	Exact Match String
Geometry Plot Position Relationship	Data collected from Internet. Question and answers were designed by the annotator	Exact	Exact Match String
Video Grounding Spatial	Videos collected from VidOR (Shang et al., 2019). Re-designed questions and answers for this specific task	Contextual	Simple Match String
Adapted Cvbench Relation	Data collected from CV-Bench’s relation split (Tong et al., 2024), and adapted into exact text answer	Exact	Exact Match String
Egocentric Spatial Reasoning	Data are collected from Epic-Kitchen (Damen et al., 2018) and the Internet. Questions and answers are adapted for contextual formatted output	Contextual	Multi Ref Phrase
Trance Physics Reasoning Basic	Data are collected from Trance (Hong et al., 2023) by specifically picking up samples with the easiest settings. Questions and answers are re-designed for this specific task	Exact	Exact Match String
CLEVER Moving Direction Video	Video data are collected from MVBench (Li et al., 2024e). Questions and answers are adapted for the contextual formatted output format	Contextual	Multi Ref Phrase
Trance Physics Reasoning Event	Data are collected from Trance (Hong et al., 2023) by selecting settings where objects are moved. Questions and answers are re-designed for indicating changed objects	MC	Set Equality
3D Fragments Understanding	We write rendering scripts to produce the data from the assets of the Break Bad dataset (Sellán et al., 2022)	Numerical	Simple Match String

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Physical Property Reasoning	Images are collected from the Internet, questions and answers are designed by annotator	Contextual	Simple String Match
CIEVRER Physics	Images are collected from CLEVRER (Yi et al., 2019), questions and answers are re-designed for testing the understanding of physical status	Numerical	Exact String Match
CIEVRER Video Moving Object Property Recognition	The videos are collected from MVBench (Li et al., 2024e), the questions and answers are adapted to test the understanding of physical property and dynamics	Contextual	Multi Ref Phrase
Trance Physics Reasoning View	Data are collected from Trance (Hong et al., 2023) by selecting the most challenging settings (objects are moved, and two states are captured by different cameras). Questions and answers are re-designed for indicating changed objects	MC	Set Equality
Photoshop Operation	Images are collected from the Web, questions and answers designed by annotator	Structured	Jaccard Index
Relative Reflectance Of Different Regions	Images come from BLINK (Fu et al., 2024c), the annotator added one more point per image and converted the task into a reflectance sorting task	Structured	Sequence Equality
Autonomous Driving Scene Analysis	Images are collected from the Internet, questions and answers are designed by annotator	Exact	Exact Str Match Case Insensitive
Functionality Matching In Different Objects	The images come from BLINK (Fu et al., 2024c). The annotator manually added one ref point per image to augment the task	Structured	Dict Equality
NLVR2 Two Image Compare QA	Images are collected from NLVR2 (Suhr & Artzi, 2019). Questions and answers re-designed by the annotator	MC	Multi Ref Phrase
Egocentric Analysis Single Image	The images are collected from Epic-Kitchens (Damen et al., 2018). Questions and answers are re-designed by the annotator	Exact	Exact String Match Case Insensitive
CIEVR Object Existence Video	Videos are collected from MVBench (Li et al., 2024e). Questions and answers are slightly adapted	MC	Simple String Match

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
SNLI-VE Visual Entailment	Data are collected and converted from SNLI-VE dataset (Xie et al., 2019)	Exact	Exact String Match
OCR Open-ended QA	Images collected from the Internet. Questions and answers made up by the annotator for the open-ended output format	Open	GPT-4o as Judge
Super Scene Understanding	Images are collected from SuperCLEVR (Li et al., 2023b). Questions and answers are re-designed by the annotator	Contextual	Multi Ref Phrase
Visual Dialog Image Guessing	Images are collected from Visual Dialog dataset (Das et al., 2017). Questions and answers are designed by the annotator	MC	Exact String Match
Semantic Matching Of Two Images	Images come from BLINK dataset (Fu et al., 2024c). The annotator augmented the data by adding one more ref point and re-designed the answer	Structured	Dict Equality
Recover Masked Word In Figure	The annotator took screenshots from a few public papers on arXiv and designed the question-answer pairs	Contextual	Simple String Match
Graph Interpretation	The images of line/dot graphs are collected from the Internet, and the annotator created the question and open-ended reference answer	Open	GPT-4o as Judge
Science Figure Explanation	The images of science figures are collected from the Internet, and the annotator created the question and open-ended reference answer	Open	GPT-4o as Judge
Bar Chart Interpretation	The images of bar graphs are collected from the Internet, and the annotator created the question and open-ended reference answer	Open	GPT-4o as Judge
Electricity Load Estimate Plot	The temporal data were collected from Informer (Zhou et al., 2021) and AutoFormer (Wu et al., 2021). The annotator re-processed the data to design a more specific task	Numerical	Normalized RMSE
Average Humidity Estimate Plot	The temporal data were collected from AutoFormer (Wu et al., 2021). The annotator re-processed the data to design a more specific task	Numerical	Normalized RMSE

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Exchange Rate Estimate Plot	The temporal data were collected from Lai et al. (2018) and AutoFormer (Wu et al., 2021). The annotator re-processed the data to design a more specific task	Numerical	Normalized Rmse
Road Map Find Highway Between Two Place	The road map images were collected from Seed-Bencn (Li et al., 2024c) and the Internet. Questions and answers are designed by the annotator	Exact	Exact Match String
Transit Map Intersection Points	The transit map images were collected from Seed-Bencn (Li et al., 2024c) and the Internet. Questions and answers are designed by the annotator	Structured	Exact Match, Sequence Equality Case Insensitive
Panel Images Single Question	Panel images were collected from (Fan et al., 2024). Questions and answers were designed by the annotator	MC	Exact Match String
Knowledge Graph Understanding	The large knowledge graph image was collected from the Internet. Questions and answers were designed by the annotator	Contextual	Set Equality
Panel Images Multi Question	Panel images were collected from (Fan et al., 2024). Questions and answers were designed by the annotator	Structured	Exact Match String
Mindmap Elements Parsing	Mindmap images were collected from Seed-Bencn (Li et al., 2024c) and the Internet. Questions and answers are designed by the annotator	Structured	Set Equality Case Insensitive
Dvqa	Images were collected from Dvqa dataset (Kafle et al., 2018). Questions and answers were re-designed by the annotator	Numerical	Multi Ref Phrase
Figureqa	Images were collected from FigureQA dataset (Kahou et al., 2017). Questions and answers were re-designed by the annotator	MC	Multi Ref Phrase
Map Diagram Qa	Images were collected from MapQA dataset (Chang et al., 2022). Questions and answers were re-designed by the annotator	Contextual	Simple Match String
Chart Vqa	Data were collected from MathVista (Lu et al., 2023) (statistics subset) and converted into a more specific task	Numerical	General Single Numerical Match

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Photo Sharing Image Retrieval	Images were from the PhotoChat (Zang et al., 2021) dataset. Questions and answers are designed by the annotator	MC	Exact Match String
Multi Load Type Prediction From Plot	The temporal data were collected from Informer (Zhou et al., 2021) and AutoFormer (Wu et al., 2021). The annotator re-processed the data to design a more specific task	MC	Sequence Accuracy Case Insensitive
Stock Price Future Prediction	The annotator downloaded data from Yahoo! Finance’s API, and processed data to design this task	Contextual	Normalized Rmse
Traffic Future Prediction From Line Plot	The temporal data were collected from AutoFormer (Wu et al., 2021). The annotator re-processed the data to design a more specific task	Numerical	Normalized Rmse
Electricity Plot Future Prediction	The temporal data were collected from AutoFormer (Wu et al., 2021). The annotator re-processed the data to design a more specific task	Numerical	Normalized Rmse
Ili Ratio Future Prediction	The temporal data were collected from AutoFormer (Wu et al., 2021). The annotator re-processed the data to design a more specific task	Numerical	Normalized Rmse
Paper Vqa	The annotator took high-resolution screenshots of a few papers on arXiv, and designed the questions and answers	Contextual	Simple Match String
Doc Vqa	Data and open-ended QA pairs were converted from DocMatix (HuggingFaceM4, 2024)	Open	GPT-4o as Judge
FunSD Document Qa	Images were collected from FunSD (Jaume et al., 2019). Questions and answers were designed by annotator	Contextual	Simple Match String
OCR Article Journal	The article screenshots were taken from various websites. Questions and answers were created by the annotator	Contextual	Simple Match String
IAM Line Ocr And Locate	Images were collected from the IAM handwritten database (Marti & Bunke, 1999). Questions and answers were re-designed by the annotator	Structured	Exact Match, Normalized Similarity Damerau Levenshtein

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
OCR Resume Experience Plain	The resume screenshots were taken from various websites. Questions and answers were created by the annotator	Contextual	String Set Equality Line Break
Newspaper Ocr In Query Box	Images were collected from The Newspaper Navigator Dataset (Lee et al., 2020). Questions and answers were adapted by the annotator into simple string answer format.	Contextual	Simple String Match
OCR Resume Skill Plain	The article screenshots were taken from various websites. Questions and answers were created by the annotator	Contextual	String Set Equality Line Break
OCR Resume Employer Plain	The article screenshots were taken from various websites. Questions and answers were created by the annotator	Contextual	String Set Equality Line Break
Finance Table Understanding	Images were collected from MMMU (Yue et al., 2024a). Questions and answers were adapted by the annotator into direct numerical output format	Numerical	Exact String Match
Monthly Weather Days Count	Images were collected from the Microsoft Weather by taking screenshots. Questions and answers were designed by the annotator.	Structured	Exact String Match
Table Understanding Complex Question Answering	Tables were collected from WikiTableQuestions (Pasupat & Liang, 2015) and TabFact (Chen et al., 2019). Questions and answers were designed by the annotator	Contextual	Simple String Match
Table Understanding Fetaqa	Data were collected and converted from FetaQA (Nan et al., 2022)	Open	GPT-4o as Judge
Table Understanding Fact Verification	Tables were collected from WikiTableQuestions (Pasupat & Liang, 2015) and TabFact (Chen et al., 2019). Questions and answers were designed by the annotator	Contextual	Dict Precision
Electricity Future Prediction From Table	The temporal data were collected from AutoFormer (Wu et al., 2021). The annotator reprocessed the data to design a more specific task	Numerical	Normalized Rmse

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics	
Video Detail Description	Video and description data were collected from VideoDetailCaption (Maaz et al., 2023) and converted into a specific task	Open	GPT-4o as Judge	
Guess Image Generation Prompt	Examples were collected from various online text-to-image generation demos	Open	GPT-4o as Judge	
Docci Image Description Long	Data were collected from DOCCI (Onoe et al., 2024)	Open	GPT-4o as Judge	
Tweets Captioning	The annotator collected the data from X by taking screenshots and the texts	Open	GPT-4o as Judge	
Image Captioning With Additional Requirements	Images were collected from various sources on the Web. The annotator used Claude 3.5 Sonnet to generate reference answers and manually polished them	Open	GPT-4o as Judge	
Ad Count Detection	Image were collected from various websites by taking screenshots. Questions and answers created by the annotator	Numerical	Exact Match	String
Adapted Cvbench Count	Data were collected from CV-Bench’s counting split (Tong et al., 2024) and adapted into a specific task by rewriting the question-answer pairs	Numerical	Exact Match	String
Av Vehicle Multi-view Counting	Images were collected from the nuScenes (Caesar et al., 2020) dataset. The annotator designed the questions and implemented a script to generate the answers from the raw annotation	Numerical	Exact Match	String
Counting Multi Image	Data were collected from Mantis (Jiang et al., 2024a) and adapted into direct numerical answer	Numerical	Exact Match	String
Av Human Multi-view Counting	Images were collected from the nuScenes (Caesar et al., 2020) dataset. The annotator designed the questions and implemented a script to generate the answers from the raw annotation	Numerical	Exact Match	String
Shape Composition Shapes	Images were made by the annotator using Canva. Questions and answers were created by the annotator	Structured	Positive Int Match	
Counting Single Image	Data were collected from Mantis (Jiang et al., 2024a) and adapted into direct numerical answer	Numerical	Exact Match	String

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
CLEVRER Video Moving Object Count	Video data are collected from MVBench (Li et al., 2024e). Questions and answers are adapted for the direct numerical output	Numerical	Exact String Match
Shape Composition Colours	Images were created by the annotator using Canva. Questions and answers were created by the annotator	Structured	Positive Int Match
Face Identity Matching	Images were collected from CelebA (Liu et al., 2015). Questions and answers re-designed by the annotator for this specific task	Numerical	Set Equality
Rocks Samples Identify	Images, questions, and answers were collected from the Web by the annotator	Contextual	Simple String Match
Animal Pose Estimation	Images were collected from AP-10K (Yu et al., 2021). The annotator implemented a script to produce the answer from raw annotations for this task	Numerical	Sequence Coords Similarity
License Plate Recognition	Images were collected from the Web. Questions and answers were created by the annotator	Exact	Exact Str Match Case Insensitive
Image Style Recognition	Images were collected from the Web. Questions and answers were created by the annotator	Exact	Exact Str Match Case Insensitive
Long String Letter Recognition	Data were designed by the annotator and generated automatically with code	Exact	Exact String Match
COCO Object Detection By Query Property	Images were from MSCOCO (Lin et al., 2014). Questions and answers were re-designed by the annotator and adapted manually	Numerical	Exact String Match, Nbbox Iou Tuple
Widerface Face Count And Event Classification	Images were collected from WiderFace (Yang et al., 2016). Questions and answers were designed and produced by the annotator	Structured	Exact String Match, Simple String Match
Handwritten Math Expression Extraction	Data were collected from HME100K (Yuan et al., 2022)	Contextual	Latex Expr Equality
Geometry Reasoning Circled Letter	Image were collected from Rahmazadehgervi et al. (2024) are manually created. Questions and answers were re-designed by the annotator	Structured	Exact String Match, Sequence Equality

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Av Multicamera Tracking Predict Bbox	Images were collected from the nuScenes (Caesar et al., 2020) dataset. The annotator designed the questions and implemented a script to generate the answers from the raw annotation	Numerical	Nbbox Iou Sequence
ASCII Art Understanding	Data and annotations were collected and created by the annotator from various online resources	MC	Exact Match String
Face Keypoint Detection	Raw data were from CelebA (Liu et al., 2015). The annotator wrote a script to produce the answers for this task	Structured	Sequence Similarity Coords
Extract Webpage Headline	Images were collected from VisualWebBench (Liu et al., 2024a). Questions and answers were adapted by the annotator	Contextual	Simple Match String
Waldo	Images and annotations were collected and created by the annotator using various resources on the Web	Structured	Dict Nbbox Iou Tuple Agg Jaccard
Geographic Remote Sensing Land Cover	Images and annotations were collected and converted from SATIN (Roberts et al., 2023)	Contextual	Sequence Equality
Signboard Identification	Images were collected from the Internet. The annotator created the question-answer pairs	Contextual	Simple Match String
Long String Number Recognition	Data were designed by the annotator and generated automatically with code	Exact	Exact Match String
Waybill Number Sequence Extraction	Images were collected from the Internet. The annotator created the question-answer pairs	Contextual	Simple Match String
Single Person Pose Estimation	hello, this is Source Description	Structured	Sequence Similarity Coords
COCO Person Detection	Images were from MSCOCO (Lin et al., 2014). Questions and answers were re-designed by the annotator and adapted with a script	Numerical	Exact Match, Nbbox Iou Tuple
Places365 Scene Type Classification	Images were collected from Places365 (Zhou et al., 2017). Questions and answers were re-designed and generated by the annotator	Exact	Exact Match String
Visual Prediction Rater Openable Part Segmentation	Images were collected using screenshots from arXiv papers' qualitative results. Questions and answers were created by the annotator	MC	Sequence Equality

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Visual Prediction Rater Panoptic Segmentation	Images were collected using screenshots from qualitative results from the arXiv papers. Questions and answers were created by the annotator	MC	Sequence Accuracy Case Sensitive
Visual Prediction Rater Semantic Segmentation	Images were collected using screenshots from the qualitative results of the arXiv papers. Questions and answers were created by the annotator	MC	Sequence Accuracy Case Sensitive
Video To Camera Trajectory Retrieval	Data were collected from the project page of VD3D (Bahmani et al., 2024). Questions and answers designed and created by the annotator	MC	Exact Match String
Scenega Scene Transition Video	Video data are collected from MVBench (Li et al., 2024e). Questions and answers are adapted by the annotator into open-ended format	Open	GPT-4o as Judge
Video Segments Reordering	Raw data come from UCF101 (Soomro et al., 2012). The annotator designed the task and re-organized the data to produce the question-answer pairs	Structured	Sequence Equality
Action Sequence Understanding	Data were collected from MileBench (Song et al., 2024). Questions and answers were designed and created by the annotator	Exact	Exact Match String
Video Action Recognition	Raw data come from UCF101 (Soomro et al., 2012). The annotator designed the task and re-organized the data to produce the question-answer pairs	Structured	Exact Match String
Google Streetview Line Sorting	The data were taken from Google Maps. Questions and answers were created by the annotator	Structured	Sequence Equality
Next Action Prediction	Data were collected from MileBench (Song et al., 2024). Questions and answers were designed and created by the annotator	MC	Exact Match String
Perception Test Video Action Count	Video data are collected from MVBench (Li et al., 2024e). Questions and answers are adapted by the annotator into direct numerical output format	Numerical	Exact Match String

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Google Streetview Line Reasoning	The data were taken from Google Maps. Questions and answers were created by the annotator	MC	Simple Match String
Video Camera Motion Description	Videos were collected from VidOR (Shang et al., 2019). Questions and answers re-designed and created by the annotator	Exact	Exact Match String
Video Grounding Temporal	Videos were collected from VidOR (Shang et al., 2019). Questions and answers re-designed and created by the annotator	MC	Simple Match String
Web Action Prediction	Data were collected from VisualWebBench (Liu et al., 2024a)	MC	Exact Match String
Cam Traj To Video Selection	Data were collected from the project page of VD3D (Bahmani et al., 2024). Questions and answers designed and created by the annotator	Contextual	Simple Match String
Sta Action Localization Video	Video data are collected from MVBench (Li et al., 2024e). Questions and answers are repurposed for the contextual formatted output format	Contextual	Simple Match String
Contain Images	Images were collected from the Web. Questions and constraints are designed by the annotator. This task has no reference answer	Open	Constrained Generation
Contain Repeat Length	Images were collected from the Web. Questions and constraints are designed by the annotator. This task has no reference answer	Open	Constrained Generation
Multi Contain Repeat Position Only Length	Images were collected from the Web. Questions and constraints are designed by the annotator. This task has no reference answer	Open	Constrained Generation
Contain Length	Images were collected from the Web. Questions and constraints are designed by the annotator. This task has no reference answer	Open	Constrained Generation
Contain Position Images	Images were collected from the Web. Questions and constraints are designed by the annotator. This task has no reference answer	Open	Constrained Generation

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Contain Position Length	Images were collected from the Web. Questions and constraints are designed by the annotator. This task has no reference answer	Open	Constrained Generation
Xor Images	Images were collected from the Web. Questions and constraints are designed by the annotator. This task has no reference answer	Open	Constrained Generation
Multi Contain Repeat	Images were collected from the Web. Questions and constraints are designed by the annotator. This task has no reference answer	Open	Constrained Generation
Contain Contain Length	Images were collected from the Web. Questions and constraints are designed by the annotator. This task has no reference answer	Open	Constrained Generation
Multi Contain Position Only	Images were collected from the Web. Questions and constraints are designed by the annotator. This task has no reference answer	Open	Constrained Generation
Relative Depth of Different Points	Images were collected from BLINK (Fu et al., 2024c). The annotator augmented each sample by adding one more reference point manually and adjusted the answers	MC	Exact Match String
Visual Prediction Rater Depth Estimation	Images were collected by taking screenshots from depth estimation papers on arXiv. Questions and answers were created by the annotator	MC	Sequence Accuracy Case Insensitive
Visual Prediction Rater Novel View Synthesis	Images were collected by taking screenshots from novel view synthesis papers on arXiv. Questions and answers were created by the annotator	MC	Sequence Equality
Pokemon 3d Recognition	Images were created by the annotator from the Pokemon Go game. Questions and answers were designed by the annotator	Structured	Exact Match String
Av View Identification	Images were collected from the nuScenes (Caesar et al., 2020) dataset. Questions and answers were designed and created by the annotator	Contextual	Sequence Accuracy Case Insensitive

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Multiview Reasoning Camera Moving	Images were collected from BLINK (Fu et al., 2024c). Questions and answers were re-designed and augmented by the annotator	Exact	Exact Match String
3d Indoor Scene Text Bbox Prediction	The data is adapted from Multi3DRefer (Zhang et al., 2023). Questions and answers were designed by the annotator and dataset annotation.	Numerical	Nbbox Iou Single
Google Streetview Circle Reasoning	The data were taken from Google Maps. Questions and answers were created by the annotator	MC	Simple Match String
Google Streetview Direction Understanding	The data were taken from Google StreetView. Questions and answers were created by the annotator	Exact	Exact Match String
Video Motion Matching Real 3d	Videos were collected from the project page of Shen et al. (2024). Questions and answers were created by the annotator	MC	Exact Match String
Video Motion Matching 3d Real	Videos were collected from the project page of Shen et al. (2024). Questions and answers were created by the annotator	MC	Exact Match String
Visual Prediction Rater 3d Assembled Quality Understanding	Data were collected from the project page of Wang et al. (2024e). Questions and answers were designed and created by the annotator	MC	Sequence Equality
Visual Prediction Rater Surface Normal Estimation	Images were collected by taking screenshots from surface normal estimation papers on arXiv. Questions and answers were created by the annotator	MC	Sequence Accuracy Case Insensitive
Adapted Cvbench Depth	Images were collected from CV-Bench (Tong et al., 2024). Answers were adapted by the annotator into exact text	Exact	Exact Match String
Visual Prediction Rater Plane Segmentation	Images were collected by taking screenshots from plane segmentation papers on arXiv	MC	Sequence Accuracy Case Insensitive
3d Indoor Scene Text Bbox Selection	Images were collected by taking screenshots from 3D scene understanding papers on arXiv. Questions and answers were designed and generated by the annotator	MC	Exact Match String

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Google Streetview Circle Sorting	The data were taken from Google Maps. Questions and answers were created by the annotator	Structured	Sequence Equality
Metrics			
Paper Review Writing	Data collected from OpenReview’s public paper reviews	Open	GPT-4o as Judge
Paper Review Rating	Data collected from OpenReview’s public paper reviews	Numerical	Number Rel Diff Ratio
Paper Review Acceptance	Data collected from OpenReview’s public paper reviews	Exact	Exact Match String
Autorater Artifact	Images were collected from ImagenHub (Ku et al., 2023). Questions and answers adapted by the annotator	MC	Exact Match String
Autorater Control	Images were collected from ImagenHub (Ku et al., 2023). Questions and answers adapted by the annotator	Exact	Exact Match String
Autorater Artifact Reason	Images were collected from ImagenHub (Ku et al., 2023). The annotator created open-ended reference answer manually	Open	Constrained Generation
Autorater Aesthetics	Images were collected from ImagenHub (Ku et al., 2023). Questions and answers adapted by the annotator	Exact	Exact Match String
Autorater Unmask	Images were collected from ImagenHub (Ku et al., 2023). Questions and answers adapted by the annotator	Exact	Exact Match String
Autorater Subject	Images were collected from ImagenHub (Ku et al., 2023). Questions and answers adapted by the annotator	Exact	Exact Match String
Autorater 3d Model Texturing	Resources are collected from the user study of Perla et al. (2024). Questions and answers were designed and created by the annotator	Contextual	Sequence Equality
Autorater Semantics	Images were collected from ImagenHub (Ku et al., 2023). Questions and answers adapted by the annotator	Exact	Exact Match String
Autorater Motion Guided Editing	Images were collected by taking screenshots from image generation papers on arXiv	MC	Sequence Equality

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics	
Autorater Mask	Images were collected from ImagenHub (Ku et al., 2023). Questions and answers adapted by the annotator	Exact	Exact Match	String
Video Eval Visual Pref	Video frames were collected from ImagenHub (He et al., 2024). Questions and answers adapted by the annotator	MC	Exact Match	String
Generated Video Artifacts	Videos were collected by running various text-to-video diffusion models online. Open-ended reference answers were written by the annotator manually	Open	GPT-4o as Judge	
Video Eval Factual Pref	Video frames were collected from ImagenHub (He et al., 2024). Questions and answers adapted by the annotator	MC	Exact Match	String
Video Eval Dynamic Pref	Video frames were collected from ImagenHub (He et al., 2024). Questions and answers adapted by the annotator	MC	Exact Match	String
Vizwiz Quality Assessment For Blind	Images were collected from Chiu et al. (2020). Questions and answers were adapted and redesigned by the annotator	Contextual	Set Equality	
Reward Models T2i Reward	Images were collected from RLAIIF-V dataset (Yu et al., 2024a). Questions and answers were adapted by the annotator	Exact	Exact Match	String
Reward Models I2t Reward	Images were collected from RLAIIF-V dataset (Yu et al., 2024a). Questions and answers were adapted by the annotator	Exact	Exact Match	String
Science				
Biology Exams V	Data collected from EXAMS-V (Das et al., 2024) and MMMU-Pro (Yue et al., 2024b), and the questions and answers are adapted to match strings	Contextual	Simple Match	String
Pmc Vqa Medical Image Qa	Data collected from NLVR2 dataset (Suhr et al., 2018), and the questions and answers are adapted to match strings	Contextual	Simple Match	String
Medical Content Based Retrieval Radiology	Data collected from ROCO dataset (Pelka et al., 2018), and the questions and answers are adapted to match strings	MC	Exact Match	String

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Medical Abdomen MRI Organ Recognition	Data collected from GMAI-MMBench (Chen et al., 2024b), and the questions and answers are adapted to match sequence accuracy	Contextual	Sequence Accuracy Case Insensitive
Medical Multi Organ Segmentation Rater	Data collected from pdf screenshot, and the questions and answers are adapted to match strings	MC	Exact Match String
Medical Cell Recognition	Data collected from GMAI-MMBench (Chen et al., 2024b), and the questions and answers are adapted to match strings	Exact	Exact Match String
Medical Image Artifacts Identification	Data collected from GMAI-MMBench (Chen et al., 2024b), and the questions and answers are adapted to match strings	Exact	Exact Match String
Medical Blood Vessels Recognition	Data collected from GMAI-MMBench (Chen et al., 2024b), and the questions and answers are adapted to match strings	Structured	Exact Match String
Healthcare Info Judgement	Data collected from GMAI-MMBench (Chen et al., 2024b), and the questions and answers are adapted to match strings	MC	Exact Match String
Electrocardiogram	Data collected from MMMU (Yue et al., 2024a), and the answers are open-ended	Open	GPT-4o as Judge
Medical Polyp Segmentation Single Object Rater	Data collected from pdf screenshot, and the questions and answers are adapted to match sequence equality	Structured	Sequence Equality
Medical Abdomen Endoscopy Organ Recognition	Data collected from GMAI-MMBench (Chen et al., 2024b), and the questions and answers are adapted to match sequence accuracy	Contextual	Sequence Accuracy Case Insensitive
Medical Key-words Based Retrieval Non Radiology	Data collected from ROCO dataset (Pelka et al., 2018), and the questions and answers are adapted to match strings	Exact	Exact Match String
Medical Parasite Detection	Data collected from pdf screenshot, and the questions and answers are adapted to match set equality	Structured	Set Equality
Medical Retrieval Given Surgeon Activity	Data collected from GMAI-MMBench (Chen et al., 2024b), and the questions and answers are adapted to match strings	MC	Exact Match String

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Medical Counting Lymphocytes	Data collected from GMAI-MMBench (Chen et al., 2024b), and the questions and answers are adapted to match strings	Numerical	Exact Match String
Chemistry Exams V	Data collected from EXAMS-V (Das et al., 2024) and MMMU-Pro (Yue et al., 2024b), and the questions and answers are adapted to match strings	MC	Simple Match String
Science Molecule Chemistry	Data collected from IsoBench (Fu et al., 2024b), and the questions and answers are adapted by human annotator	Contextual	Simple Match String
Mmmu Pro Exam Screenshot	Data collected from MMMU-Pro (Yue et al., 2024b), and the questions and answers are adapted to match strings	MC	Exact Match String
Scibench W Solution Open Ended	Data collected from Scibench (Wang et al., 2023b), and the answers are open-ended	Open	GPT-4o as Judge, General Single Numerical Match
arXiv Vqa	Data collected from screenshots by human annotator, and the questions and answers are adapted to match strings	MC	Exact Match String
Tqa Textbook Qa	Data collected from Dvqa (Kafle et al., 2018), and the questions and answers are refractered from the original TQA dataset	Contextual	Multi Ref Phrase
Question Solution Solving	Data collected from webpage screenshots by human annotator	Contextual	General Single Numerical Match
Quizlet Question Solving	Data collected from webpage screenshots by human annotator	Contextual	General Single Numerical Match
Scibench Fundamental Wo Solution	Data collected from Scibench (Wang et al., 2023b)	Numerical	General Single Numerical Match
Mmmu Physics Chemistry Mcq	Data collected from MMMU (Yue et al., 2024a), and the questions and answers are adapted to match strings	Exact	Exact Match String
Circuit Diagram Understanding	Data collected from webpage screenshots by human annotator	Numerical	Exact Match String
Science Basic Physics	Data collected from IsoBench (Fu et al., 2024b), and the questions and answers are adapted by human annotator	Contextual	Simple Match String

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics	
Physics Exams V	Data collected from EXAMS-V (Das et al., 2024) and MMMU-Pro (Yue et al., 2024b), and the questions and answers are adapted to match strings	Contextual	Simple Match	String
Knowledge				
Background Change	Images and labels come from the MFCBench (Wang et al., 2024c) dataset. Questions and annotations were adapted by a human annotator.	MC	Exact Match	String
Out Of Context	Images and labels come from the MFCBench (Wang et al., 2024c) dataset. Questions and annotations were adapted by a human annotator.	MC	Exact Match	String
Text Entity Replace	Images and labels come from the MFCBench (Wang et al., 2024c) dataset. Questions and annotations were adapted by a human annotator.	MC	Exact Match	String
Text Style	Images and labels come from the MFCBench (Wang et al., 2024c) dataset. Questions and annotations were adapted by a human annotator.	MC	Exact Match	String
Face Attribute Edit	Images and labels come from the MFCBench (Wang et al., 2024c) dataset. Questions and annotations were adapted by a human annotator.	MC	Exact Match	String
Face Swap	Images and labels come from the MFCBench (Wang et al., 2024c) dataset. Questions and annotations were adapted by a human annotator.	MC	Exact Match	String
Interpret Force Perspective Illusion	Images come from various websites. Questions and annotations were created by a human annotator.	Exact	Exact Match	String
Clip Stable Diffusion Generate	Images and labels come from the MFCBench (Wang et al., 2024c) dataset. Questions and annotations were adapted by a human annotator.	MC	Exact Match	String
Unusual Images	Images come from various websites. Questions and annotations were created by a human annotator.	Open	GPT-4o as Judge	

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Forensic Detection Of Different Images	Images and labels come from the BLINK benchmark (Fu et al., 2024c). Questions and annotations were adapted by a human annotator.	MC	Exact Match String
Veracity	Images and labels come from the MFCBench (Wang et al., 2024c) dataset. Questions and annotations were adapted by a human annotator.	MC	Exact Match String
Distinguish AI Generated Image	Images come from various websites and image generators. Questions and annotations were created by a human annotator.	Exact	Exact Match String
Cultural Vqa	Images and labels come from the CulturalVQA benchmark (Romero et al., 2024). Questions and annotations were adapted by a human annotator.	Contextual	Multi Ref Phrase
Human Relationship Reasoning	Images come from various websites. Questions and annotations were created by a human annotator.	Contextual	Simple Match String
Sign Language	Videos come from Dr. Bill Vicars’ “Signs” YouTube channel. Questions and annotations were created by a human annotator.	Contextual	Multi Ref Phrase
Ishihara Test	Images come from various websites. Questions and annotations were created by a human annotator.	Structured	Set Precision
Llavaguard	Images and labels come from the LlavaGuard benchmark (Helff et al., 2024). Questions were created by a human annotator.	Structured	Exact Match String
Red Teaming Racial	Images and labels come from the Red Teaming benchmark (Li et al., 2024f). Questions were created by a human annotator or generated by GPT-4.	Open	GPT-4o as Judge
Red Teaming Captcha	Images and labels come from the Red Teaming benchmark (Li et al., 2024f). Questions were created by a human annotator or generated by GPT-4.	Open	GPT-4o as Judge
Red Teaming Politics	Images and labels come from the Red Teaming benchmark (Li et al., 2024f). Questions were created by a human annotator or generated by GPT-4.	Open	GPT-4o as Judge

Table 18 – continued from previous page

Task Name		Source Description	Output Format	Metrics	
Mmsoc	Hateful-memes	Images and labels come from the MMSoc benchmark (Jin et al., 2024). Questions and answers were adapted by a human annotator.	MC	Exact Match	String
Red Teaming	Visual Order B	Images and labels come from the Red Teaming benchmark (Li et al., 2024f). Questions were created by a human annotator or generated by GPT-4.	Open	GPT-4o as Judge	
Red Teaming	Celebrity	Images and labels come from the Red Teaming benchmark (Li et al., 2024f). Questions were created by a human annotator. or generated by GPT-4	Open	GPT-4o as Judge	
Mmsoc	Memo-tion	Images and labels come from the MMSoc benchmark (Jin et al., 2024). Questions and answers were adapted by a human annotator.	Structured	Exact Match	String
Mmsoc	Misinformation Politifact	Images and labels come from the MMSoc benchmark (Jin et al., 2024). Questions and answers were adapted by a human annotator.	MC	Exact Match	String
Red Teaming	Jail-break	Images and labels come from the Red Teaming benchmark (Li et al., 2024f). Questions were created by a human annotator or generated by GPT-4.	Open	GPT-4o as Judge	
Red Teaming	Visual Order A	Images and labels come from the Red Teaming benchmark (Li et al., 2024f). Questions were created by a human annotator or generated by GPT-4.	Open	GPT-4o as Judge	
Mmsoc	Misinformation Gossipcop	Images and labels come from the MMSoc benchmark (Jin et al., 2024). Questions and answers were adapted by a human annotator.	MC	Exact Match	String
Red Teaming	Visualmisleading	Images and labels come from the Red Teaming benchmark (Li et al., 2024f). Questions were created by a human annotator.	Open	GPT-4o as Judge	
Video	Content Follow Up	Videos taken from YouTube . Questions and answers created by human annotator.	Open	GPT-4o as Judge	
Meme	Explain	Images come from various websites. Questions were created by a human annotator.	Open	GPT-4o as Judge	

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Funny Image Title	Images come from various websites. Questions were created by a human annotator.	Open	GPT-4o as Judge
Emotion Recognition	Videos and labels come from the CAER dataset (Lee et al., 2019). Questions and answers were adapted by a human annotator.	Exact	Exact Match String
Image Humor Understanding	Images come from various websites. Questions were created by a human annotator.	Open	GPT-4o as Judge
Humor Explanation	Images and labels come from a Humor Understanding benchmark derived from the New Yorker Caption Contest (Hessel et al., 2022). Questions were created by a human annotator.	Open	GPT-4o as Judge
Mvsa Sentiment Classification	Images and labels come from the MVSA dataset (Niu et al., 2016). Questions and answers were adapted by a human annotator	MC	Exact Match String
Video Intent Recognition	Video and labels come from the MIntRec dataset (Zhang et al., 2022). Questions and answers were adapted by a human annotator.	Contextual	Simple Match String
Humor Understand Caption Match	Images and labels come from a Humor Understanding benchmark derived from the New Yorker Caption Contest (Hessel et al., 2022). Questions and answers were adapted by a human annotator.	Exact	Exact Match String
Figurative Speech Explanation	Images come from various websites. Questions were created by a human annotator.	Open	GPT-4o as Judge
Muma Theory Of Mind Social Goal	Images and labels come from the MuMA-ToM dataset (Shi et al., 2024). Questions and answers were adapted by a human annotator.	Contextual	Simple Match String
Muma Theory Of Mind Belief Of Goal	Images and labels come from the MuMA-ToM dataset (Shi et al., 2024). Questions and answers were adapted by a human annotator.	Contextual	Simple Match String
Hashtag Recommendation	Images and hashtags come from various social media websites. Questions were created by a human annotator.	Structured	Set Precision

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Dish Ingredient Match	Images and labels come from the HelloFresh website. Questions were created by a human annotator.	MC	Exact Match String
Music Sheet Sentiment	Images are music sheets posted to Noteflight . Questions and answers were created by a human annotator.	Exact	Exact Match String
Music Sheet Author	Images are music sheets posted to Noteflight . Questions and answers were created by a human annotator.	Exact	Exact Match String
Music Sheet Note Count	Images are music sheets posted to Noteflight . Questions and answers were created by a human annotator.	Numerical	Exact Match String
Music Sheet Format Qa	Images are music sheets posted to Noteflight . Questions and answers were created by a human annotator.	Numerical	Exact Match String
Orchestra Score Recognition	Images come from various websites. Questions were created by a human annotator.	Structured	Exact Match, String Simple String Match
Music Sheet Name	Images are music sheets posted to Noteflight . Questions and answers were created by a human annotator.	Exact	Exact Match String
Insect Order Classification	Images and labels come from the BIOSCAN-1M dataset (Gharaee et al., 2024). Questions and answers were adapted by a human annotator.	Contextual	Simple Match String
Signage Navigation	Images come from various websites. Questions and answers were created by a human annotator.	Exact	Exact Match String
Song Title Identification From Lyrics	Screenshots were taken by the human annotator on the Spotify Web Player . Questions and answers were created by the annotator.	Structured	Exact Match String
Knowledge Sign Recognition	Images come from various websites. Questions were created by a human annotator.	MC	String Set Equality Comma
Brand Logo Recognition And Elaboration	Images come from the FlickrLogo (Romberg et al., 2011) dataset and various websites. Questions were created by a human annotator.	Structured	Multi Ref Phrase

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Logo2k Same Type Logo Retrieval	Images come from the Logo2K+ dataset (Wang et al., 2020) dataset and various websites. Questions were created by a human annotator.	Structured	Exact Str Match Case Insensitive, Set Equality
Chinese Idiom Recognition	Images come from various websites. Questions and answers were created by a human annotator.	Exact	Exact String Match
Multi Lingual Ruozhiba Explanation French	Some images and labels are from the COIG-CQIA dataset (Bai et al., 2024) and some images are from Baidu Tieba and annotated by a human annotator.	Open	GPT-4o as Judge
Multi Lingual Ruozhiba Explanation Arabic	Some images and labels are from the COIG-CQIA dataset (Bai et al., 2024) and some images are from Baidu Tieba and annotated by a human annotator.	Open	GPT-4o as Judge
Multi Lingual Ruozhiba Explanation Spanish	Some images and labels are from the COIG-CQIA dataset (Bai et al., 2024) and some images are from Baidu Tieba and annotated by a human annotator.	Open	GPT-4o as Judge
Multi Lingual Ruozhiba Explanation English	Some images and labels are from the COIG-CQIA dataset (Bai et al., 2024) and some images are from Baidu Tieba and annotated by a human annotator.	Open	GPT-4o as Judge
Multi Lingual Ruozhiba Explanation Japanese	Some images and labels are from the COIG-CQIA dataset (Bai et al., 2024) and some images are from Baidu Tieba and annotated by a human annotator.	Open	GPT-4o as Judge
Multi Lingual Ruozhiba Explanation Russian	Some images and labels are from the COIG-CQIA dataset (Bai et al., 2024) and some images are from Baidu Tieba and annotated by a human annotator.	Open	GPT-4o as Judge
Font Recognition	Images and labels are taken from Identifont . Questions are created by a human annotator.	Exact	Exact String Match
Traffic Accident Analysis	Images and labels are taken from Jia Kao Bao Dian . Questions are created by a human annotator.	Open	GPT-4o as Judge
Multiple States Identify Asia	Images come from various websites and were edited by the annotator. Questions and answers were created by a human annotator.	Contextual	Sequence Accuracy Case Insensitive

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Multiple States Identify Americas	Images come from various websites and were edited by the annotator. Questions and answers were created by a human annotator.	Contextual	Sequence Accuracy Case Insensitive
Multiple States Identify Europe	Images come from various websites and were edited by the annotator. Questions and answers were created by a human annotator.	Contextual	Sequence Accuracy Case Insensitive
Multiple States Identify Africa	Images come from various websites and were edited by the annotator. Questions and answers were created by a human annotator.	Contextual	Sequence Accuracy Case Insensitive
Worldle	Images and labels are taken from Worldle Daily , a free Geoguessr alternative. Questions and answers are created by a human annotator.	Structured	Exact Match String
Location Vqa	Images and labels come from various websites. Questions were created by a human annotator.	Exact	Exact Match String
Vibe Eval Open	Images and labels come from the Vibe-Eval dataset Padlewski et al. (2024) . Questions were created by a human annotator.	Contextual	Multi Ref Phrase
Vibe Eval Phrase	Images and labels come from the Vibe-Eval dataset Padlewski et al. (2024) . Questions were created by a human annotator.	Open	GPT-4o as Judge
Ancient Map Understanding	Images and labels come from various websites. Questions were created by a human annotator.	Exact	Exact Match String
Rocks Samples Compare	Images and labels come from ChinaNeolithic.com 's online rock store. Questions were created by a human annotator.	Contextual	Simple Match String
Painting Qa	Images and labels come from the MMMU benchmark Yue et al. (2024a) . Questions and answers were adapted by a human annotator.	Exact	Exact Match String
Art Explanation	Images come from various websites. Questions were created by a human annotator.	Open	GPT-4o as Judge

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Memorization Chinese Celebrity	Images and labels come from various websites. Questions were created by a human annotator.	Structured	Multi Ref Phrase
Memorization Papers	Images and labels come from various websites. Questions were created by a human annotator.	Structured	Simple String Match
Memorization Famous Treaty	Images and labels come from various websites. Questions were created by a human annotator.	Structured	Exact String Match, Multi Ref Phrase
Memorization Indian Celebrity	Images and labels come from various websites. Questions were created by a human annotator.	Structured	Exact String Match, Multi Ref Phrase
Soccer Offside	Images come from various websites. Questions were created by a human annotator.	MC	Exact String Match
Deciphering Oracle Bone	Images and labels come from the “Deciphering Oracle Bone Language with Diffusion Models” paper (Guan et al., 2024). Questions were created by a human annotator.	Exact	Exact String Match
Kvqa Knowledge Aware Qa	Images and labels come from the MapQA dataset (Chang et al., 2022). Questions and answers were adapted by a human annotator.	Contextual	Simple String Match
Character Recognition In Tv Shows	Screenshots were taken by the human annotator on the Amazon Prime Video webpage . Questions and answers were created by the annotator.	Contextual	Set Equality
Actor Recognition In Movie	Screenshots were taken by the human annotator on the Amazon Prime Video webpage . Questions and answers were created by the annotator.	Exact	Exact String Match
Landmark Recognition And Qa	Images and labels come from the Landmark v2 dataset (Weyand et al., 2020). Questions and answers were adapted by a human annotator.	Structured	Exact String Match, Multi Ref Phrase, Near Str Match
Famous Building Recognition	Images and labels come from various websites. Questions were created by a human annotator.	Structured	Exact Str Match Case Insensitive, Exact String Match

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Landmark Check Two Images	Images and labels come from the Landmark v2 dataset (Weyand et al., 2020). Questions and answers were adapted by a human annotator.	Structured	Exact Str Match Case Insensitive
Defeasible Reasoning	Images and labels come from various websites. Questions were created by a human annotator.	Open	GPT-4o as Judge
Poetry Limerick	Images come from various websites. Questions and evaluation constraints were created by a human annotator.	Open	Constrained Generation
Poetry Shakespearean Sonnet	Images come from various websites. Questions and evaluation constraints were created by a human annotator.	Open	Constrained Generation
Poetry Custom Rhyming Scheme	Images come from various websites. Questions and evaluation constraints were created by a human annotator.	Open	Constrained Generation
Poetry Acrostic Alliteration	Images come from various websites. Questions and evaluation constraints were created by a human annotator.	Open	Constrained Generation
Poetry Haiku	Images come from various websites. Questions and evaluation constraints were created by a human annotator.	Open	Constrained Generation
Poetry Petrarchian Sonnet Optional Meter	Images come from various websites. Questions and evaluation constraints were created by a human annotator.	Open	Constrained Generation
Poetry Acrostic	Images come from various websites. Questions and evaluation constraints were created by a human annotator.	Open	Constrained Generation
Ascii Art 30	Images come from various websites. Reference ASCII art images were created using the ASCII Art Archive's "Image to ASCII Art" tool .	Contextual	ASCII Art GPT-4o Judge
Mathematics			
Graph Path Kawai	Data collected from Visual Graph Arena Dataset by human annotator, and the questions and answers are adapted to match strings	Numerical	Exact String Match

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Graph Shortest Path Planar	Data collected from Visual Graph Arena Dataset by human annotator, and the questions and answers are adapted to match strings	Numerical	Exact Match String
Graph Connectivity	Data collected from IsoBench (Fu et al., 2024b), and the questions and answers are adapted by human annotator	Structured	Exact Match String
Graph Theory	Data collected from MathVision (Wang et al., 2024b), and the questions and answers are adapted by human annotator	Exact	Exact Match String
Graph Isomorphism	Data collected from IsoBench (Fu et al., 2024b), and the questions and answers are adapted by human annotator	MC	Exact Match String
Graph Hamiltonian Cycle	Data collected from Visual Graph Arena Dataset by human annotator, and the questions and answers are adapted to match set precision	Structured	Exact Match, Set Precision String
Graph Hamiltonian Path	Data collected from Visual Graph Arena Dataset by human annotator, and the questions and answers are adapted to match set precision	Structured	Exact Match, Set Precision String
Graph Chordless Cycle	Data collected from Visual Graph Arena Dataset by human annotator, and the questions and answers are adapted to match strings	Numerical	Exact Match String
Topological Sort	Data collected from screenshots by human annotator	Structured	Set Equality
Graph Maxflow	Data collected from IsoBench (Fu et al., 2024b), and the questions and answers are adapted by human annotator	Numerical	Exact Match String
Scibench Calculus Wo Solution	Data collected from Scibench (Wang et al., 2023b)	Numerical	General Numerical Match Single
Clevr Arithmetic	Data collected from Clevr (Johnson et al., 2017)	Numerical	Exact Match String
Iconqa Count And Reasoning	Data collected from IConQA (Lu et al., 2021), with annotation refractered from the original IConQA dataset	Numerical	Multi Ref Phrase
Number Comparison	Data collected from screenshots by human annotator	Numerical	Exact Match String

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Math Exams V	Data collected from MMMU-Pro (Yue et al., 2024b), and the questions and answers are adapted to match numerical data	MC	General Single Numerical Match
Theoremqa	Data collected from screenshots by human annotator	Contextual	Boxed Single Numerical Match
Math	Data collected from screenshots by human annotator	Numerical	Boxed Single Numerical Match
Math Parity	Data collected from IsoBench (Fu et al., 2024b), and the questions and answers are adapted by human annotator	MC	Exact String Match
Math Breakpoint	Data collected from IsoBench (Fu et al., 2024b), and the questions and answers are adapted by human annotator	Numerical	Exact String Match
Math Convexity Value Estimation	Data collected from IsoBench (Fu et al., 2024b), and the questions and answers are adapted by human annotator	Structured	Exact String Match, Number Rel Diff Ratio
Geometry Reasoning Count Line Intersections	Data collected from Vision language models are blind (Rahmanzadehgervi et al., 2024), and the questions and answers are adapted by human annotator	Structured	Exact String Match
Geometry Length	Data collected from MathVision (Wang et al., 2024b), and the questions and answers are adapted by human annotator	Contextual	General Single Numerical Match
Geometry Reasoning Nested Squares	Data collected from Vision language models are blind (Rahmanzadehgervi et al., 2024), and the questions and answers are adapted by human annotator	Structured	Exact String Match
Geometry Transformation	Data collected from MathVision (Wang et al., 2024b), and the questions and answers are adapted by human annotator	Contextual	General Single Numerical Match
Geometry Reasoning Overlapped Circle	Data collected from Vision language models are blind (Rahmanzadehgervi et al., 2024), and the questions and answers are adapted by human annotator	Structured	Exact String Match
Geometry Area	Data collected from MathVision (Wang et al., 2024b), and the questions and answers are adapted by human annotator	Numerical	Exact String Match

Table 18 – continued from previous page

Task Name	Source Description	Output Format	Metrics
Geometry Reasoning Grid	Data collected from Vision language models are blind (Rahmanzadehgervi et al., 2024), and the questions and answers are adapted by human annotator	Structured	Exact Match String
Polygon Interior Angles	Data collected from screenshots by human annotator	Numerical	Angle Seq Float Rmse
Geometry Solid	Data collected from MathVision (Wang et al., 2024b), and the questions and answers are adapted by human annotator	Contextual	General Numerical Match Single
Geometry Analytic	Data collected from MathVision (Wang et al., 2024b), and the questions and answers are adapted by human annotator	Contextual	General Numerical Match Single
Geometry Descriptive	Data collected from MathVision (Wang et al., 2024b), and the questions and answers are adapted by human annotator	Contextual	General Numerical Match Single
Counterfactual Arithmetic	Data collected from screenshots by human annotator	Numerical	Exact Match String
Algebra	Data collected from MathVision (Wang et al., 2024b), and the questions and answers are adapted by human annotator	Contextual	General Numerical Match Single

H AUTHOR CONTRIBUTION STATEMENT

All authors contributed at least 30 tasks to MEGA-BENCH and participated in task brainstorming, annotation, and validation. They also engaged in discussions on data annotation and provided feedback. The following authors made additional contributions to various aspects of the project:

Jiacheng Chen co-designed the project with Wenhui Chen, led the benchmark construction process, and coordinated collaboration among all contributors. Jiacheng Chen created and maintained the annotation GUI tool, GitHub repository, draft task taxonomy tree, and results visualization page to facilitate data annotation and improve data quality. Jiacheng Chen led the development and maintenance of the benchmark evaluation pipeline, including the VLM query pipeline, customized evaluation metrics, HuggingFace Space for the project, etc., and conducted the main experiments and analyses. Jiacheng Chen also led the writing of the paper, coordinating core contributors and incorporating their input into the manuscript.

Tianhao Liang co-led the benchmark data organization, implemented most model query and evaluation pipelines under a consistent and unified framework, and conducted the experiments and analyses. Tianhao Liang also maintained the evaluation pipeline and implemented the code execution metric. Tianhao Liang made significant efforts in data quality control, error analysis, and creating figures and tables for the paper.

Sherman Siu made contributions to the benchmark construction process, including task reviewing, annotator coordination, data quality control, metric implementation, and code maintenance. Sherman Siu contributed and designed a bunch of complex and novel planning tasks. Sherman Siu also analyzed the number of examples per task to investigate the variance of the benchmark score and contributed to writing the main paper.

Zhengqing Wang contributed around 40 tasks, including several complex traditional computer vision tasks. Zhengqing Wang organized the benchmark statistics for the Appendix, participated in error case analysis, and developed the project page.

Kai Wang contributed around 40 tasks with diverse data sources and output formats. Kai Wang helped organize the benchmark construction process and actively checked the annotation quality of other annotators.

Yubo Wang assisted with the experiments of open-source models.

Yuansheng Ni helped organize the Appendix and polished §B to §F.

Wang Zhu implemented the evaluation metric for symbolic planning tasks and helped with the paper writing.

Hexiang Hu participated in discussions of the project’s initial idea and continuously provided thoughts and resources for diverse tasks to facilitate the benchmark construction process. Hexiang Hu wrote a significant portion of the main paper, advised on experimental design, and helped present tables and figures.

Xiang Yue discussed the high-level directions and goals of the project with Jiacheng Chen and Wenhui Chen. Xiang Yue provided insightful thoughts for multi-dimensional results analysis and assisted with the experiments of open-source models.

Wenhui Chen proposed the initial concepts of the project, continuously advised on project progress while refining its strategic scope and direction, and called up and organized all contributors. Wenhui Chen contributed approximately 50 diverse tasks, generated ideas for new tasks, and distributed them to other annotators. Wenhui Chen wrote the initial draft of the main paper to establish the high-level structure and guided the organization and analysis of the results.
