# CSL: A Large-scale Chinese Scientific Literature Dataset for Cross-task Evaluation 

Anonymous ACL submission

#### Abstract

Scientific literature serves as a high-quality corpus, which could provide natural annotated data for many natural language processing (NLP) research. In this work, we introduce a Chinese Scientific Literature dataset - CSL, which contains the titles, abstracts, keywords and academic fields of 400,000 papers. The rich semantic information in these scientific literature creates extensive NLP tasks and provides a natural cross-task scenario. Based on this, we present a cross-task few-shot benchmark. To evaluate the cross-task transferability of the model, we design scenarios with different aspects and difficulties. Compared with previous cross-task benchmarks, these tasks are constructed from homogeneous corpus, allowing researchers to investigate the relationships between tasks, without being disturbed by heterogeneous data sources, annotation, and other factors. We analyze the behavior of existing text-to-text models on the proposed benchmark, and reveal the challenges for cross-task generalization, which provides a valuable reference for future research. Code and data are publicly available at GitHub ${ }^{1}$.

## 1 Introduction

As the embodiment of human research knowledge, scientific literature is known as a rich source of informative data, supporting various NLP research (Luan et al., 2018; Cohan et al., 2019). So far, several scientific-related resources e.g. large-scale literature corpus (Lo et al., 2020; Saier and Färber, 2020), citation graphs (Sinha et al., 2015; Tang et al., 2008; Zhang et al., 2019), scientific downstream tasks (Lee et al., 2020; Beltagy et al., 2019) are available. Previous works, however, have primarily relied on digital libraries, such as arXiv, PubMed, CiteSeerX and ACL Anthology, which are mostly centered around the English language and focus on specific research fields.

[^0]To fill the gap of non-English scientific corpora, in this paper we introduce CSL: a large-scale Chinese Scientific Literature dataset. CSL is obtained from 1982 Chinese core journals and contains meta-information of 400,000 papers with a wide range of distribution and fine-grained discipline annotation (67 categories).

Scientific literature metadata contains massive corpus information, making it a natural annotated data source with the potential to provide many highquality NLP tasks. For example, predicting the title with abstract constitutes a summarization task, and predicting the discipline is a classification task. There are hundreds of such combinations. These tasks are constructed with homogeneous data, encouraging models to share knowledge across tasks.

Cross-task generalization, i.e., how to learn a new task efficiently based on the experiences of previous tasks, is an hot area in NLP community (Ye et al., 2021; Bragg et al., 2021; Sanh et al., 2021; Zhong et al., 2021). Previous studies mostly rely on heterogeneous data to create cross-task scenarios. For example, Ye et al. (2021) use 160 diverse NLP datasets to build a few-shot NLP gym; Bragg et al. (2021) use 20 dataset to construct transfer scenarios. For those cross-task scenarios above, there are multiple task-agnostic variables, such as data sources, annotation and task formats, making it difficult to reveal the relationship between specific tasks. In this paper, we introduce our cross-task benchmark, which includes a series of tasks where underlying knowledge and distribution are shared. We aim to reduce the variance of heterogeneous data and focus on evaluating connections among tasks, as well as providing a testbed for cross-task research.

We present three cross-task scenarios that are common in real applications. Each is made up of meta training tasks (meta tasks) and disjoint fewshot evaluation tasks (few-shot tasks). These scenarios show different relationships between tasks,

| Title | Abstract | Keywords | Discipline | Category |

Table 1：Examples of the CSL dataset．
and vary in difficulties．It allows us to better un－ derstand how the connection of tasks affects the cross－task performance of the model．We provide a prompt－based text－to－text method as our base－ line，which allows full parameter sharing across different task formats and easier transfer learning． Experiment results show that text－to－text language models are capable of cross－task transfer．However， in some challenging scenarios，there is still room for improvement．

The main contributions of this paper are summa－ rized as follows：
－We release the first large－scale Chinese Sci－ entific Literature dataset（CSL），which can be used for many different purposes，e．g．pre－ training corpus and scientific－related tasks．
－Based on the CSL，we introduce a benchmark including different scenarios for cross－task few－shot evaluation．
－We propose a prompt－based method as our baseline and the experiment results highlight the model＇s difficulties in learning across tasks．

## 2 The CSL Dataset

## 2．1 Data Collection and Processing

We collect Chinese papers＇homepage from pub－ licly available search engines（Wanfang Data ${ }^{2}$ and CNKI ${ }^{3}$ ）dated 2010 to 2020，then use the XSS parser to extract the meta－information in each web page，such as the title，abstract，keyword，and the journal in which the paper was published．To im－ prove data quality，we filter the data as follows： First，we exclude papers that are not published in the Core Journals of China．Second，we filter out papers from comprehensive journals，and only pre－ serve papers from professional journals．

According to Classification of Chinese Instruc－ tional Programs，academic fields are divided into

[^1]| Category | $d$ | $\operatorname{len}(t)$ | $\operatorname{len}(a)$ | num $(k)$ | $\#$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Engineering | 27 | 19.1 | 210.9 | 4.4 | 177 k |
| Science | 9 | 20.7 | 254.4 | 4.3 | 35 k |
| Agriculture | 7 | 17.1 | 177.1 | 7.1 | 39 k |
| Medicine | 5 | 20.7 | 269.5 | 4.7 | 37 k |
| Management | 4 | 18.7 | 157.7 | 6.2 | 23 k |
| Jurisprudence | 4 | 18.9 | 174.4 | 6.1 | 21 k |
| Pedagogy | 3 | 17.7 | 179.4 | 4.3 | 16 k |
| Economics | 2 | 19.5 | 177.2 | 4.5 | 11 k |
| Literature | 2 | 18.8 | 158.2 | 8.3 | 10 k |
| Art | 1 | 17.8 | 170.8 | 5.4 | 5 k |
| History | 1 | 17.6 | 181.0 | 6.0 | 6 k |
| Strategics | 1 | 17.5 | 169.3 | 4.0 | 3 k |
| Philosophy | 1 | 18.0 | 176.5 | 8.0 | 7 k |
| All | 67 |  |  |  | 400 k |

Table 2：The statistics of CSL dataset．
13 categories（Engineering，Medicine，etc．）and 67 disciplines（Mechanical Engineering，Oral Medicine，etc．）．For each professional journal in the Core Journal Catalog，we associate it with a discipline based on the journal＇s description and published papers．Therefore，papers are annotated with two classification labels according to the pub－ lished journal．For example，papers from＂Chinese Journal of Computers＂are categorized into Engi－ neering category and Computer Science discipline．

Finally，we collect 400 K instances for CSL dataset，represented as a tuple $<t, a, k, c, d>$ ， where $t$ is the title，$a$ is the abstract，$k$ is a list of keywords，$c$ is the textual category label and $d$ is the textual discipline label．CSL covers a wild range of academic fields，Table 1 shows the concrete exam－ ples in CSL dataset and the detailed statistics are provided in Table 2.

## 2．2 Task Formats

The current version of the CSL dataset contains 5 columns，which constitutes $\sum_{i=1}^{5}\left(\sum_{j=1}^{5-i} C_{5}^{j} \times\right.$ $\left.C_{5-j}^{i}\right)=180$ different tasks，where $i$ and $j$ are the number of input and output fields．

Previous works（Raffel et al．，2020；Gao et al．， 2020）try to unify different tasks into general for－ mat for easier transfer learning．We extend this idea by designing task－specific prompts which cast

Figure 1: Overview of CSL task specific-prompts. (A) A content snapshot of the tabular CSL dataset. (B) TLM is a text-to-text language model. Prompts are added in front of input text such that different tasks can share loss function and output layers.
all CSL tasks into "text-to-text" format. For the CSL prompt, the input and output relationships are indicated by arrow characters, and multiple fields are coupled by plus signs. This prompt allows the model to predict multiple targets (i.e. one/many-to-many tasks) in a unified manner. Fig 1 gives a schematic overview of CSL prompts and tasks.

## 3 Cross-task Benchmark

Based on scientific NLP tasks derived form CSL dataset, we construct different cross-task scenarios, each of which contains pairs of meta tasks $T_{\text {meta }}$ and disjoint few-shot test tasks $T_{\text {few }}$.

The model initially only has access to $T_{\text {meta }}$ for meta training purpose, which captures the pattern in which the task structure differs from target tasks. The model's task-transferability is then evaluated by investigating the meta training stage's relative performance gain on learning $T_{\text {few }}$.

To comprehensively analyze the cross-task generalization, we manually design three scenarios concentrated on different aspects and varied in difficulties (i.e. the difficulty for few-shot tasks to leverage from meta tasks), each of which contains several partitions of $T_{\text {meta }}$ and $T_{\text {few }}$. Tasks and their prompts are shown in Table 3. We sample 100 instances for each meta tasks and k-shot (k samples per class for classification tasks) for few-shot tasks with 8 different random seeds. $0,1,2,4,8$ shot(s) are used for zero/few-shot training and 64 for validation/test.

### 3.1 Single-leap Bridging

In Scenario 1, we evaluate the implicit bridging proposed by Johnson et al. (2017) as a zero-shot translation solution. It represents a real-world application where there is rare training data between the source field and the target field, an interme-

| Part. | Meta Tasks | Few-shot Tasks |
| :---: | :---: | :---: |
| Scenario 1 |  |  |
| 1-1 | Abst. $\rightarrow$ Kw., Kw $\rightarrow$ Title. | Abst. $\rightarrow$ Title. |
| 1-2 | Kw. $\rightarrow$ Title, Title $\rightarrow$ Dcp. | Kw. $\rightarrow$ Dcp. |
| 1-3 | Abst. $\rightarrow$ Title+Ctg., Title $\rightarrow$ Kw. | Abst.+Dcp. $\rightarrow$ Kw. |
| Scenario 2 |  |  |
| 2-1 | $\begin{aligned} & \text { Abst. } \rightarrow \text { Kw., Kw. } \rightarrow \text { Title } \\ & \text { Title } \rightarrow \text { Ctg. } \end{aligned}$ | Abst. $\rightarrow$ Ctg. |
| 2-2 | $\begin{aligned} & \text { Abst. } \rightarrow \text { Title., Title } \rightarrow \text { Kw. } \\ & \text { Kw. } \rightarrow \text { Dcp. } \end{aligned}$ | Abst. $\rightarrow$ Dcp. |
| Scenario 3 |  |  |
| 3-1 | Kw. $\rightarrow$ Abst., Title $\rightarrow$ Dcp. | Kw. $\rightarrow$ Dcp. |
| 3-2 | $\begin{aligned} & \text { Abst. } \rightarrow \text { Kw., Title } \rightarrow \text { Kw. } \\ & \text { Title } \rightarrow \text { Ctg. } \end{aligned}$ | Abst. $\rightarrow$ Ctg. |

Table 3: Task prompts for each partition, Ctg: Category, Dcp: Discipline, Kw: Keywords, Abst: Abstract.
diate field can be utilized as a bridge. For example Abstract $\rightarrow$ Keywords and Keywords $\rightarrow$ Discipline enable a zero-shot task Abstract $\rightarrow$ Discipline. Based on this, we design partition ${ }_{1-1}$ and partition ${ }_{1-2}$ representing naive single-leap implicit bridging tasks, partition $_{1-3}$ explores semiconnected bridging with one-to-many and many-toone tasks.

### 3.2 Two-leap Bridging

Expanding the single-leap bridging, in Scenario 2, there are two intermediate fields between the source field and the target field, implying that three meta tasks are involved in the bridging. Additional meta tasks bring more samples for meta training, which theoretically have the same potential upper bound as Scenario 1. However, achieving it requires stronger transferability, which poses a tougher challenge for few-shot learners. In partition $n_{2-1}$ and partition $_{2-2}$, we design meta tasks spanning through two leaps.

### 3.3 Broken Bridge

In real-world scenarios, it can be difficult to locate the intermediate field that connects sources and

|  |  | Scenario 1 |  |  |  |  |  |  | Scenario 2 |  |  |  |  |  | Scenario 3 |  |  |  |

Table 4: Performance of text-to-text models on cross-task evaluation. The columns few presents directly finetuning on $T_{\text {few }}$, the +meta is first fine-tuning on $T_{\text {meta }}$ (meta-tuning) and then on $T_{\text {few }} . \Delta_{m}$ is the Average Relative Gain of meta-tuning. We report the average metrics for each task: TS: text summarization, KG: keyword generation, CLS: classification.
targets. In Scenario 3, we cut off the bridges in meta tasks to imitate this condition, making the few-shot tasks even more challenging. It aims to study the impact of non-bridging homologous meta tasks on few-shot target tasks. Based on partition $_{1-2}$ and partition $n_{2-1}$, we create partition $_{3-1}$ and partition $_{3-2}$ by modifying one of the meta tasks, which causes the bridge disconnected while the others unchanged.

## 4 Experiments

### 4.1 Baseline and Metrics

We consider different pre-trained text-to-text models including T5 (Raffel et al., 2020) and BART (Lewis et al., 2019) as our baselines. However, since there are few publically available Chinese versions of them, we conduct pre-training from scratch. Pre-training details are shown in Appendix A.

Following (Ye et al., 2021), we use multi-task fine-tuning to evaluate the above pre-trained models with and without meta tasks (i.e. meta-tuning) separately in each partition. Fine-tuning hyperparameters and other details are shown in Appendix B. We report the average of results over repeated experiments. The evaluation toolkit can be found in Appendix C.

For evaluation metrics, we adopt ROUGE-L and BLEU for summarization tasks; F1 and Bpref (Buckley and Voorhees, 2004) for keyword generation tasks. Classification tasks adopt accuracy and F1 macro as metrics. All the metrics are calculated at Chinese character level.

### 4.2 Results and Analysis

We observe from Table 4 that, the gain of metatuning $\left(\Delta_{m}\right)$ is positive on average, meaning that meta tasks generally improve task generalization. In Scenario 1, the meta tasks boost the performance
of the few-shot tasks dramatically, and this benefit is sustainable as the shots increases.

For Scenario 2, the benefit of meta-tuning to few-shot tasks is first noticeable, but it quickly fades with the increment of training samples and eventually drops. Finally, the models fine-tuned directly on $T_{\text {few }}$ sometimes outperform the metatuned models. For example, partition $n_{2-2}$ has the same target as partition $n_{1-2}$, i.e. discipline classification, but it receives more informative input. As a result, it outperforms partition ${ }_{1-2}$ in direct few-shot fine-tuning. However, compared with the former, it gains less from meta-tuning for the average $\Delta_{m}$ drops by \%4.9. This demonstrates that two-leap bridging indeed increases the difficulty.

In Scenario 3, we found the $\Delta_{m}$ of partition ${ }_{3-1}$ and partition $_{3-2}$ show the similar changing trend as partition $n_{1-2}$ and partition ${ }_{2-1}$. However, in comparison, they have decreased by $2.0 \%$ and $5.1 \%$ on average. The results suggest that meta-tuning on homologous tasks generally improves few-shot learning, and implicit that bridging is a key factor affecting the task generalization.

More detailed experiment results and our other findings are demonstrated in Appendix D.

## 5 Conclusion

In this paper, we provide a large-scale Chinese Scientific Literature dataset (CSL) and use it to evaluate few-shot cross-task generalization. This represents the challenge of addressing low-resource tasks with high-resource tasks. From the experiment results, we observe that homogeneous meta tasks generally improve few-shot learners, however, when the bridge is broken, this benefit becomes negligible. We also release an open-source toolkit for extensive evaluation.

## A Pre-training Chinese Text-to-text Language Models

For pre-training Chinese text-to-text models, we follow the architecture, optimization, and hyperparameter choices described in (Raffel et al., 2020; Lewis et al., 2019; Zhang et al., 2020). Following Chinese BERT model (Devlin et al., 2019), we use the tokenizer with a vocabulary of 21,128 Chinese characters. Models are trained for $1,000,000$ steps with the sequence length of 128 and then trained for 250,000 additional steps with 512 sequence length on CLUE Corpus (Xu et al., 2020) with the batch size of 512 .

## B Fine-tuning Hyperparameters

For comprehensive evaluation, we additional evaluate different sizes of T5, BART and PEGASUS. When fine-tuning different pre-trained models. we use the same hyperparameters. The settings of hyperparameters are as follows. The learning rate is set to 3e-4 for T5 and 1e-5 for BART and PEGASUS, the batch size is 32 for training on $T_{\text {meta }}$ and 1 for training on $T_{\text {few }}$. We set the number of epochs to 15 with early stopping. The maximal input and output length are set to 256 , which can be shortened according to the length of the task data to speed up training. All results are reported with greedy decoding (i.e. choosing the highest-probability logit at every timestep). All experiments are conducted on 1 Tesla V100 GPU and the results are collected over average of 8 episodes. Altogether, the experiments take around 2000 GPU hours, the full results are shown in Table 9.

## C Pre-training and Evaluation Toolkit

We use UER-py ${ }^{4}$ (Zhao et al., 2019) as our pretraining and fine-tuning platform. Based on which we implement a toolkit for cross-task evaluation including function modules: (1) Sampling Kshot examples for meta/few-shot tasks according CSL evaluation protocol. (2) Conducting metatuning on meta tasks and fine-tuning on fewshot tasks. Code, dataset and pre-trained models are available at https://github.com/ CSL-Dataset/CSL_Dataset.

## D Additional Analysis and Samples

We provide full results broken down by partitions in Table 9. In this section, we describe other findings.

Larger models perform better on few-shot tasks but small models are more likely to benefit from meta-training. As with previous common sense, larger models perform better on average for various tasks. However, smaller models have considerable task transferability, sometimes better than large models. For example, the average $\Delta_{m}$ of BART-base is $3.7 \%$, while of BART-small is $4.4 \%$.

Sentence-level denoising pre-training performs better on few-shot learning. In the majority of cases, BART and PEGASUS outperform T5. We speculate that it is because T5 is pre-trained with token-level denoising tasks, whereas BART and PEGASUS are pre-trained with sentence-level denoising tasks, which makes pre-training tasks closer to downstream tasks, allowing for easier few-shot transfer.

Meta-tuning on bridging tasks enables zeroshot learning. In 0 -shot rows, we present results of direct evaluating meta-tuned models on $T_{\text {few }}$ without few-shot training, which indicates promptbased text-to-text models have zero-shot task generalization.

Large-scale fine-tuning enables multi-task language generator. We fine-tuned a T5-base model with full CSL training set and all tasks. Output samples of summarization and keyword generation tasks are shown in Table 5 and Table 6. Conditional text generation samples are shown in Table 7. For the rules of constructing CSL prompt is extensible, which makes prompts feasible at the inference phase even it is unseen during the training. For example, "Abstract $\rightarrow$ Abstract" indicates rewriting a given input abstract. Table 8 presents samples of zero-shot text rewriting task. The samples for these different tasks above all come from the same model.

Input Text：通过对美国职业排球运动员进行非结构性访谈研究美国职业排球运动员对赞助商和赞助行为的态度．．．赞助商应尊重运动员的情感和观点，从而使双方都能获得长远利益．
Through interviews，research was conducted on the attitudes of American professional volleyball players regarding spon－ sors and sponsorship activities ．．．Sponsors should respect athletes＇feelings and opinions in order for both sides to profit in the long run．
Prediction：美国职业排球运动员对赞助商和赞助行为的态度研究
Research on American Professional Volleyball Players＇Atti－ tudes Towards Sponsors and Sponsorship Behaviors
Ground Truth：美国排球运动员对赞助的态度分析 Analysis of American Volleyball Players＇Attitudes towards Sponsorship

Table 5：Samples of summarization．

## Prompt：摘要－＞关键词

Abstract－＞Keywords
Input Text：位置跟踪是移动机器人自主导航中的一个主要任务．．．文中给出了一个基于线性系统模型的位置估计方法
Position tracking is a major task in the autonomous navi－ gation of mobile robots ．．．This paper proposes a position estimation method based on the linear system model．
Prediction：移动机器人；位置估计；线性系统模型；线性近似
Mobile robots；Position estimation；Linear system model； Linear approximation
Ground Truth：移动机器人；位置跟踪；卡尔曼滤波
Mobile robots；Position tracking；Kalman filter

## Prompt：摘要－＞关键词

Abstract－＞Keywords
Input Text：通过对祁连山自然保护区周边农牧民经济状况的调查发现阻碍经济发展的问题．．．提出了发展生态旅游等适合本地区经济发展的模式。
Problems with economic development were discovered dur－ ing an investigation of the economic conditions of farmers and herders in the Qilian Mountain Nature Reserve ．．．Eco－ tourism and other models for local economic development were proposed．
Prediction：祁连山自然保护区；农牧民；经济发展模式 Qilian Mountain Nature Reserve；Peasants and herdsmen； Economic development model
Ground Truth：祁连山自然保护区；周边经济；发展模式 Qilian Mountain Nature Reserve；Peripheral economy；De－ velopment model

Table 6：Samples of keywords generation．

## Prompt：标题－＞摘要

Title－＞Abstract
Input Text：藏东南地区生态旅游资源评价与开发建议
Evaluation and Development Suggestions on Ecotourism Resources in Southeastern Tibet
Prediction：藏东南地区是我国重要的生态旅游资源区，其旅游资源的开发是一个重要的课题。本文从旅游资源的评价与开发的角度，对藏东南地区生态旅游资源开发的现状进行了分析，并提出了相应的开发建议。
Southeast Tibet is a significant ecotourism resource area in China，and the development of its tourism resources is a key issue．This paper focuses on the current of development of ecotourism resources in Southeast Tibet from the standpoint of tourism resource evaluation and development．Also，make recommendations for the future development．

[^2]Table 7：Samples of conditional text generation．

## Prompt：摘要－＞摘要

## Abstract－＞Abstract

Input Text：自蔓延高温合成（shs）技术是一种材料制备的新工艺，但该技术存在的某些局限性阻碍了它的进一步发展和工业化应用。
Self－propagating high－temperature synthesis（shs）technol－ ogy is a new process for material preparation，but some limitations of this technology hinder its further development and industrial application．
Prediction：自蔓延高温合成方法是一种将非金属超细胞材料及聚醚基金属离子转换成金属基金属的新技术，它以其独特的特点而成为一种化学研究的热点．该技术在材料制备领域的应用受到科技企业的认可和研究，但它的优越性并没有显著影响其在工业上商业化应用的进一步发展。
The self－propagating high－temperature synthesis method is a new technology that converts non－metallic supercellular materials and polyether－based metal ions into metal－based metals．With its unique characteristics，it has become a hot spot in chemical research．In the field of material preparation， it is recognized and researched by technology companies， but its superiority has not significantly affected the further development of its commercial applications in industry．

## Prompt：摘要－＞摘要

Abstract－＞Abstract
Input Text：烟大轮渡铁路栈桥采用两跨式全焊变截面下承式钢板梁，跨度为 $52.645 \mathrm{~m}+29.855 \mathrm{~m}$ ．从结构形式，提升方式等方面介绍该栈桥的十大关键性技术。
The Yantai Ferry Railway Trestle uses a two－span fully welded variable cross－section through steel plate girder with a span of $52.645 \mathrm{~m}+29.855 \mathrm{~m}$ ．Ten key technologies of the trestle are introduced from the aspects of structure，lifting methods，etc
Prediction：烟大轮渡桥是烟西市第一座高龄全焊变截面下承式钢板梁斜拉桥。在整体展示桥梁结构，桥梁板结构等方面介绍了该桥的关键技术，进而为该桥长期保持桥梁的强度构造奠定了有利实践基础。
Yanxi City＇s first all－welded variable cross－section steel plate girder cable－stayed bridge is the Yantai Ferry Bridge．This paper introduces the bridge＇s key technologies in the context of the overall display of the bridge structure and the bridge slab structure，and then lays a favorable practical foundation for the bridge＇s long－term strength．
