

CMMaTH: A Chinese Multi-modal Math Skill Evaluation Benchmark for Foundation Models

Anonymous ACL submission

Abstract

Due to the rapid advancements in multimodal large language models, evaluating their multi-modal mathematical capabilities continues to receive wide attention. Despite the datasets like MathVista proposed benchmarks for assessing mathematical capabilities in multimodal scenarios, there is still a lack of corresponding evaluation tools and datasets for fine-grained assessment in the context of K12 education in Chinese language. To systematically evaluate the capability of multimodal large models in solving Chinese multimodal mathematical problems, we propose a Chinese Multi-modal Math Skill Evaluation Benchmark, named CMMaTH, containing 23k multimodal K12 math related questions, forming the largest Chinese multimodal mathematical problem benchmark to date. CMMaTH questions from elementary to high school levels, provide increased diversity in problem types, solution objectives, visual elements, detailed knowledge points, and standard solution annotations. We have constructed an open-source tool GradeGPT integrated with the CMMaTH dataset, facilitating stable, rapid, and cost-free model evaluation. Our data and code are available¹

1 Introduction

Large language models(LLMs) excel in various language tasks, while multimodal models effectively handle visual-language problems. They advance natural language processing and computer vision fields, providing powerful solutions for complex tasks. Multimodal large models demonstrate potential as versatile solvers for multimodal problems.

The systematic evaluation of large models' performance across various mathematical reasoning scenarios has been a subject of extensive research. GSM8K and MATH(Cobbe et al., 2021; Hendrycks et al., 2021b) assessed the ability in multi-step

mathematical reasoning by constructing a high-quality set of elementary school math word problems or various competition mathematics problems. By collecting a diverse set of mathematical problems containing both textual and visual components, Lu et al. (2023); Wang et al. (2024); Zhang et al. (2024b) systematically evaluated the ability of large multimodal models to perceive visual elements and solve corresponding multimodal problems. Shi et al. (2023) constructed a multilingual mathematical reasoning dataset, MGSM, for evaluating the LLM reasoning ability in multilingual environments.

However, in non-English multimodal contexts, especially in Chinese scenarios, there is still a lack of sufficiently detailed and diverse benchmarks for assessing mathematical abilities. To assess the capability of large language models in non-English contexts, Huang et al. (2023) and Zhang et al. (2024a) constructed multidisciplinary Chinese question answering datasets C-Eval and CMMU to evaluate the knowledge and reasoning abilities of multimodal large models. However, C-Eval lacks evaluation in multimodal contexts, while CMMU's dataset has relatively low diversity, consisting of only 540 questions.

Existing Math benchmarks for answer evaluation can be categorized into two types: *Rule-based* (Cobbe et al., 2021; Hendrycks et al., 2021b; He et al., 2024) and *API-based* methods (Lu et al., 2023; Zhang et al., 2024b; Hendrycks et al., 2021a). *API-based* methods are very costly and time-consuming, and they often result in unstable and inconsistent evaluation results. *Rule-based* methods, on the other hand, struggle to handle highly diverse contents of benchmarks. Also, it is difficult to maintain handcrafted rules for dynamically updated benchmarks. Current multimodal math benchmark evaluations often resort to multiple-choice or true/false question formats, using rules or API-based LLM to extract options for assessing

answers.

Based on above considerations, we propose a new multimodal mathematical benchmark CM-MaTH. Compared to previous benchmarks, our benchmark demonstrates greater diversity, increased depth of reasoning, and finer-grained knowledge annotation for multimodal models to grasp different levels and types of knowledge. We provided and open-sourced a lightweight answer comparator called GradeGPT, designed to compare the consistency between outputs from different LLM/LMMs and standard answers, thus avoiding expensive evaluation costs. Leveraging the CMMaTH dataset and GradeGPT tool, we evaluated mainstream open-source and commercial multimodal large models in Table 4, reporting comprehensive evaluation results along with extensive case analyses. In summary, our paper makes the following contributions:

- We introduce the largest high-quality Chinese multimodal mathematics benchmark with the most detailed annotation granularity to date. We also provide an English version of this dataset. The CMMaTH dataset is a dynamically maintained and will be periodically updated.
- Compared to previous multimodal mathematical benchmarks, our dataset exhibits great depth of reasoning and diversity. Our benchmark simulates more realistic educational Q&A scenarios, encompassing a wider variety of question types and answer formats. Additionally, we annotate each question with detailed knowledge points and corresponding

skills to evaluate the mastery level of current large models.

- We build an evaluation assistant named GradeGPT on the CMMaTH dataset, which allows for comparing the proximity of model responses to standard answers and assessing the correctness of results and processes. GradeGPT features lightweight open-source characteristics, avoiding the instability and high costs associated with commercial models.
- We conduct a systematic evaluation of existing mainstream multimodal large models, quantitatively and qualitatively comparing with existing models.

2 Related Work

2.1 Assessment of mathematical abilities

To evaluate the performance of large models in mathematical reasoning and examine hallucinations during the reasoning process, numerous benchmarks have been proposed for evaluating the mathematical reasoning capabilities of large models. GSM8K(Cobbe et al., 2021) is the first and most widely used mathematical dataset used for large model math evaluation, consisting of 1k math word problem test samples and corresponding answers. The MATH(Hendrycks et al., 2021b) dataset, in comparison to GSM8K, presents a greater challenge in terms of reasoning difficulty. This dataset demands a more profound understanding and intuition in various mathematical domains such as Algebra, Number Theory, and Geometry.

148 MathVista(Lu et al., 2023) is the first dataset used
 149 to evaluate the multimodal mathematical capabili-
 150 ties of large models, but it has relatively simple rea-
 151 soning depth. MATH-VISION(Wang et al., 2024)
 152 has richer visual elements and deeper reasoning dif-
 153 ficulty. MathVerse(Zhang et al., 2024c) constructed
 154 several subsets of datasets to assess whether exist-
 155 ing multimodal large models can truly understand
 156 mathematical abstract forms.

157 The CMMaTH Benchmark, in comparison to
 158 existing works on the evaluation of mathematical
 159 proficiency, places a greater emphasis on the analy-
 160 sis of mathematical abilities within the context of
 161 the Chinese language. The data distribution of the
 162 CMMaTH dataset more closely aligns with the ac-
 163 tual distribution found in K12 educational settings,
 164 and it provides detailed annotations of mathemat-
 165 ical knowledge points to facilitate the assessment
 166 of models' mastery of knowledge and skills.

167 2.2 Large Model Evaluation Tool

168 Due to their strong generalization capabilities and
 169 extensive world knowledge, large language mod-
 170 els have achieved outstanding results in tasks such
 171 as machine translation(Zhu et al., 2023), question
 172 answering(Kamaloo et al., 2023), dialogue(Duan
 173 et al., 2023) and so on by generating text. Evalu-
 174 ating the comprehensive abilities of large models,
 175 such as clarity, adherence to instructions, compre-
 176 hensiveness, formality, and mathematical reason-
 177 ing ability, has received widespread attention(Ke
 178 et al., 2023). Currently, many works opt to use
 179 powerful commercial model APIs, such as GPT-4,
 180 to assist in evaluating the comprehensive abilities
 181 of large models. For instance, MathVista(Lu et al.,
 182 2023) and GeoEval(Zhang et al., 2024b) use GPT-
 183 4's API to extract correct answers for evaluation.
 184 These methods face several challenges: they are
 185 costly and time-consuming, and they struggle to
 186 keep up with rapid model iterations. Besides, these
 187 methods face challenges in terms of consistency
 188 and reproducibility(Wang et al., 2023a; Ke et al.,
 189 2023).

190 Recent methods have proposed using met-
 191 rics such as BERT score(Zhang et al., 2020) or
 192 MAUVE(Pillutla et al., 2021) for evaluation. How-
 193 ever, the numerical indicators produced by these
 194 methods are difficult to interpret when it comes to
 195 the erroneous responses generated by LLM. Pan-
 196 daLM and CritiqueLLM (Wang et al., 2023b; Ke
 197 et al., 2023) are similar to our work. They pro-
 198 posed a fine-tuning method based on open-source

LLMs, distilling the evaluation capabilities of GPT-
 199 3.5 into a series of smaller open-source models.
 200 However, they are focused on the automated evalua-
 201 tion of more general text generation tasks, while
 202 we are targeting the automated evaluation of re-
 203 sponds from large models for multimodal mathe-
 204 matics problems.

Unlike PandaLM(Wang et al., 2023b) trying
 206 to evalution relative conciseness, clarity and so
 207 on, our evaluation model, GradeGPT, is a dataset-
 208 oriented answer comparator that can provide spe-
 209 cific reasons based on the standard answer and a
 210 model's response. We distilled the answer compar-
 211 ison capability of GPT-4 using the Cross-Lingual
 212 Judge-of-Chain method and enhanced GradeGPT's
 213 answer discrimination ability.

215 3 CMMaTH Dataset

216 3.1 Overview of CMMaTH

217 We selected diverse multimodal mathematical prob-
 218 lems from a vast pool of K12 educational questions,
 219 comprising 23856 items across 13 visual themes,
 220 5 difficulty levels, and encompassing 150 types of
 221 knowledge points. More detailed statistical data
 222 can be found in Table 1.

223 For the convenience of evaluation, we pro-
 224 vide a miniaturized test set of CMMaTH, called
 225 CMMaTH-testmin, containing 1500 samples. Test-
 226 min retains the diversity of the CMMaTH dataset
 227 and shows similar overall performance to the entire
 228 CMMaTH dataset. Evaluators can conduct quick

3.2 Collection Guidelines

We collected a large number of multimodal mathematics questions from a vast K12 educational question bank, including elements such as statistical charts, plane geometry, three-view diagrams, flowcharts, set notation diagrams, etc. The quality and distribution of the data were guided by the following criteria during collection.

- Diverse Mathematical Visual Elements. We have collected solutions to multimodal mathematical problems that rely on understanding image content, especially those containing a large amount of Chinese visual content such as text and symbols. Table 2 shows some visual elements subject of CMMaTH.
- High relevance to the K12 math knowledge and skill. The annotator, who is well-versed in knowledge, needs to ensure that the multimodal question assesses a specific K-12 mathematics knowledge point during the question collection process. It primarily includes mathematics questions related to K12 education, facilitating the assessment of the application potential of large-scale multimodal capabilities in the field of mathematics education.
- High-quality images and answers. During the collection phase, we instruct collectors to disregard multimodal math questions with erroneous symbols or low-quality images (blurry

images). Collectors are required to ensure that the collected questions are generally solvable.

3.3 Data Collections

Collection from Diverse Multimodal Math Sources CMMaTH’s data is based on a million-level private database. The private database we used comes from questions collected from the Internet and undergoes rigorous data checking. The project’s data has undergone multiple rounds of collection. We first sampled 45,000 multimodal math questions: 14,000 each from elementary, high, and junior high schools. Then, we added 34,000 more questions featuring algorithm block diagrams, statistics, and geometry diagrams to enhance visual diversity.

Data Filtering We filtered out all questions without images in the question stems, including questions with multi-graph reasoning, questions in non-Chinese languages, and questions not relying on visual content to solve. To ensure the quality of the images and text questions, we removed all images whose width and height were less than 100, then used the GPT4 API to score the data quality and filter out questions suspected of being unsolvable and questions with garbled text in the question text.

Data Labeling For K-12 mathematics knowledge points, we have scraped the mathematics section from Jiaoyan Cloud² and organized all the knowledge points into a knowledge tree including a total of 5,531 knowledge points. We retained 2,299 knowledge points more relevant to multimodal

mathematics in K-12. Subsequently, all questions were classified according to knowledge points by GPT-4 and a fine-tuned LLM, followed by manual multi-level verification. Questions that did not match any K-12 multimodal mathematics knowledge points were filtered out.

3.4 Comparison with Existing Benchmarks

The CMMaTH dataset is primarily used to evaluate multimodal reasoning capabilities in K-12 educational scenarios. We compared the current mainstream multimodal mathematical datasets and large model benchmarks in Table 3. Compared to existing multimodal benchmarks and multimodal reasoning benchmarks, the CMMaTH dataset has the following characteristics:

Extreme Diversity Currently, there is a severe lack of high-quality Chinese multimodal mathematics datasets. MATH-VISION lacks a Chinese component, the MATH-VISTA dataset contains only a small number of Chinese samples, and CMMMU contains only 540 math problems, which are not fine-grained and comprehensive enough. We have included about 23k fine-grained multimodal mathematics assessment samples, covering 13 K12 mathematics visual categories, making it the largest known multimodal Chinese dataset to date.

Real and High Quality & Multilingual MathVista features a substantial number of problems that are associated with natural and synthetic images. However, these images do not accurately represent the genuine data distribution encountered in K12 mathematics educational settings. OlympiadBench is an Olympiad-level bilingual multimodal benchmark. However, this benchmark is overly challenging and deviates from the application of LMM in real K12 multimodal math scenarios. Additionally, the variety of multimodal visual elements is relatively limited. Instead, we collect multimodal data specifically tailored to the K12 education context. Additionally, MathVista incorporates a significant

amount of data from GeoQA and synthetic images, which have relatively poor image quality. Our multimodal visual image elements have all undergone stringent image quality assessments. Unlike CMMU, CEval, and CMath, our dataset is a bilingual dataset that considers a large number of Chinese scenes. In addition to the text of the questions being in Chinese, the visual elements related to the questions also contain Chinese text/symbols.

High-quality Fine-grained Annotation and Evaluation Tool Every question in our dataset is meticulously annotated with standardized answers, solutions expressed in natural language, associated multimodal knowledge points, visual element categories, and K-12 grade levels. This fine-grained annotation enables a more nuanced evaluation of multimodal mathematical proficiency within the K-12 educational context. While MathVista and GeoEval rely on GPT-4 for answer extraction and validation, we introduce an open-source model named GradeGPT. GradeGPT stands out by providing a stable, cost-free, and swift accuracy evaluation specifically tailored for the CMMaTH dataset.

4 GradeGPT

The CMMaTH dataset encompasses a large variety of problem-solving objectives, such as mathematical expressions, multiple-choice options, numerical outcomes, coordinate points, conclusion figures, and correctness assessments. Traditionally, in reasoning or evaluation contexts, problems have been formulated as multiple-choice or true/false questions to facilitate comparison and to simplify the extraction of results. Also, it is difficult to maintain dynamically updated benchmark. Employing API models for evaluation is prohibitively expensive, and the resulting evaluations are not consistently stable, which also hampers the iterative development of models on benchmarks, such as hyperparameter selection.

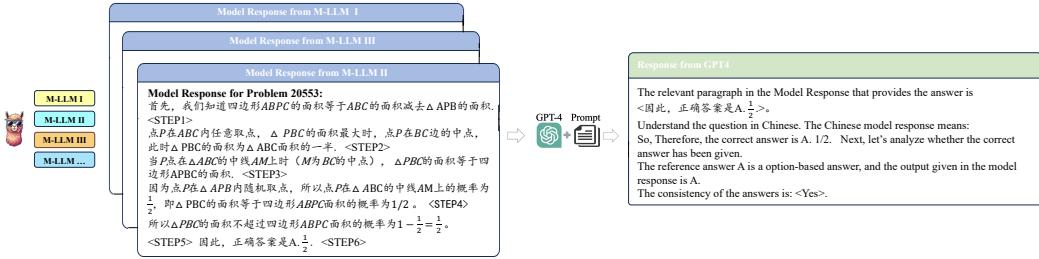

Figure 3: Instruction Construction Pipeline of GradeGPT

To provide a stable, free, fast, and easy-to-update model response evaluation tool, we introduce GradeGPT, an answer comparison model tailored for the CMMaTH dataset. GradeGPT is designed to receive a question, its standard answers, and a model-generated response. It extracts key steps including results from Chinese output. Determine whether the result is consistent with the standard answer. Our GradeGPT is a streamlined, open-source model. When integrated with frameworks such as vLLM using the 14B model, it can swiftly compare a myriad of model-generated answers, accomplishing a remarkable judgment accuracy of 96.1% for assessing responses comparable with GPT4 API.

Prompt Format

In the prompt input of GradeGPT, there are "questions," "reference answers," and "model output answers." The model is required to provide an answer in the form of "<Yes>" or "<No>" indicating whether the model output answer is equivalent to the standard reference answer. We have designed an instruction format named Cross-Lingual-Judge-of-Chain for the purpose of determining answer consistency. Cross-Lingual-Judge-of-Chain first analyzes the model response and finds the key sentences that give the answer in the model response, understand key chinese sentences in English. Then analyze the standard answer, determine the type of the standard answer, and then determine whether

the standard answer is included in the model response. More details can be found in Appendix E **Instruction Construction**

We first generate inference results on CMMaTH using multiple Multimodal LLMs and provide GPT-4 with a detailed few-shot prompt to synthesize answer judgments in the form of a Cross-Lingual Judge-of-Chain response. By employing GPT4's In-Context Learning, as shown in Figure 3, we have established a procedure for synthesizing instruction data and have produced approximately 56k cross-lingual result judge instruction pairs. Through fine-tuning the model with these instructions, we are able to obtain an expert model, GradeGPT, which possesses the capability to compare answers.

5 Experiments

We conducted a series of experiment to evaluate various models on the CMMaTH dataset. We evaluated various LLM/LMM models, including open-source and closed-source models. More model details can be found in Table 13. We employed a method similar to GeoEval and MathVista, generating captions through an GPT4V, and assessed them using MetaMath, and DeepSeekMath equipped with caption information. Our empirical research reveals that even the most advanced models struggle to achieve satisfactory accuracy levels. Furthermore, we conducted an exhaustive error analysis on

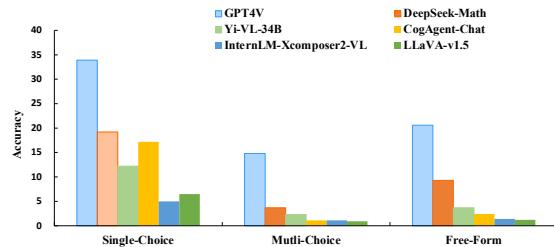

Figure 4: Accuracy of LMMs across different types of problems in CMMaTH Benchmark.

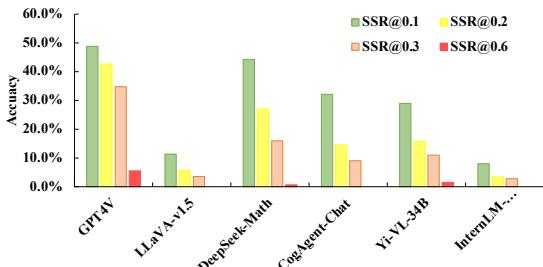

Figure 5: The metrics of different LMMs/LLMs models about SSR.

a sufficiently strong commercial multimodal model, GPT-4V, examining its error distribution and presenting illustrative qualitative examples. Our investigation also revealed that the inclusion of multilingual thought chains does not mitigate the substantial difficulties presented by Chinese multimodal mathematical reasoning scenarios. We postulate that the richness of non-English contextual information contained within the images necessitates models equipped with enhanced multilingual OCR and sophisticated multimodal diagram reasoning capabilities.

5.1 Main Experiments on LLM/LMMs

We evaluated the results of mainstream multimodal large models and mathematical expert models in Table B. We analyzed the trend of existing large models in descending with problems and conditions, as well as the effectiveness of techniques such as Cross-Lingual Prompting in solving Chinese multimodal mathematical problems. The experimental in Table 4 results indicates that our data exhibits extremely strong diversity and relatively challenging reasoning depth. Figure 1 and Table 4 shows models such as GPT4V struggle to comprehend our multimodal content and reasoning questions effectively, resulting in significant performance gaps between open-source and proprietary models. In

certain rare visual domains, multimodal large models achieve very low reasoning outcomes.

Accuracy on various question types. We evaluated the accuracy of GPT4V on various target-solving tasks in Figure 4. The results indicate that when solving free-form problems, especially those with more diverse targets such as expressions, coordinates, and conclusion judgments, the multimodal large language model shows poorer performance.

Is OCR information sufficient for CMMaTH?

We also referred to works like MathVista, attempting to use LLMs combined with OCR information from diagrams to assist in mathematical reasoning in Table 4. We found that, in our benchmark, a small amount of OCR information (such as mathematical symbols in diagrams, axis values, and image titles) made it very difficult to complete our multimodal mathematical reasoning tasks. The results indicate that solving problems in CMMaTH requires stronger multimodal mathematical chart capabilities, beyond just OCR.

K12 Multimodal Knowledge Richness of current LMMs. We systematically evaluated the proficiency of existing multimodal large models in the K12 domain regarding multimodal reasoning skills in Figure 5. The results revealed a significant knowledge gap in existing multimodal K12 educational resources. Compared to other existing LMMs, GPT4V possesses a richer knowledge base, thereby substantially reducing the illusion of reasoning in multimodal mathematical inference.

5.2 Experiments of Cross-language Reason Technology

We also attempted several multilingual Chain-of-Thought approaches such as En-CoT, CLP(Cross-Lingual Prompting) used by Qin et al. (2023) to observe whether multimodal mathematical problems could be enhanced through context learning techniques without training. The results indicate that multilingual CoT methods face challenges in solving, possibly due to the abundance of Chinese contextual text in the image content, which may necessitate the model to demonstrate excellent cross-lingual OCR capabilities. We have included more details on the implementation of Cross-Lingual Prompting and En-CoT on the CMMaTH dataset in the Table 5.

Table 5: The performance of train-free CoT reasoning techniques on the CMMaTH dataset.

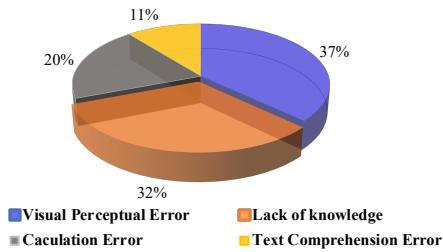

Figure 6: Distribution of Error Types in GPT4V.

into four types: perceptual errors, reasoning errors, calculation errors, and Reject Errors. The error type distribution of GPT4V on CMMaTH is shown in the Figure 6.

Perception Errors

Perception Error refers to the model’s erroneous interpretation and utilization of diagram content during reasoning. For example, incorrect OCR, misidentification of numerical relationships, geometric relationships, logical relationships, etc.

Reasoning Errors

Reasoning Error are quite common during the solving process. For instance, the model may misinterpret symbols or use incorrect logic or knowledge for inference. The frequency of Reasoning Errors reflects the model’s logical and mathematical reasoning capabilities.

Calculation Errors

Calculation Error refers to the model performing incorrect mathematical operations, such as writing equations or solving equations incorrectly.

Reject Errors

Reject Error refers to the model’s inability to solve a problem that is actually solvable. The frequency of such errors reflects the model’s ability to follow instructions.

6 Conclusions

We introduce CMMaTH, a detailed Chinese math reasoning benchmark with diverse question types, vivid visuals, and complex reasoning. The benchmark includes detailed knowledge points, standard thought processes, and grade levels to measure the mastery of knowledge points in the K-12 multimodal math skill. To evaluate large multimodal models quickly and affordably, we built GradeGPT, an open-source tool for assessing results. Extensive experimental results on CMMaTH manifest the limitations of current models in multilingual, multimodal math reasoning.

548 Limitation & Potential Impact

549 Our dataset CMMaTH, as a multimodal mathematics dataset aimed at the K-12 education sector, can
550 facilitate model evaluation and iteration of multi-
551 modal large models in this field, and may promote
552 the research and development of educational artifi-
553 cial intelligence. CMMaTH primarily consists of
554 single-image problems, without considering multi-
555 image contextual reasoning or scenarios requiring
556 auxiliary line drawing and similar tasks. GradeGPT
557 is a result-oriented, relatively coarse reasoning re-
558 sponse evaluator. How to construct a process eval-
559 uation model for fine-grained assessment of the
560 reasoning ability of large models can continue to
561 be explored in the future.

765 B Model Generation Details

766 B.1 Model Weight Version

767 We evaluated models on CMMaTH, includ-
768 ing open-source models such as LLaVA-v1.5,
769 Deepseek-Math, InternLM-XComposer2-VL,
770 Yi-
771 VL-34B, CogAgent-Chat, MetaMath-70B, LLama-
772 70B, Baichuan-13B and Qwen-14B as well as state-
773 of-the-art commercial models GPT4V. We have
774 listed the parameter versions and the Hugging Face
775 repository names of the open-source models used
in Table 12.

776 B.2 Model Sampling Parameter

777 We have listed the corresponding hyperparameters
778 used by the models in Table 13. For API mod-
779 els, we have indicated the corresponding release
780 versions. Models using vLLM for inference are
781 annotated.

782 B.3 Data quality control

783 To ensure the high quality of the final data, we
784 conducted sampling and manual verification. We
785 performed three random samples, each consisting
786 of 500 multimodal samples, to check the data qual-
787 ity and ensure the consistency of the knowledge
788 points and data.

789 C Prompt Details

790 C.1 Prompt For Step Response Generation

791 When evaluating hallucinations during the assess-
792 ment process, we use a few-shot prompt format
793 to elicit step-by-step outputs from the model as
794 showed in Table 6.

795 C.2 Prompt For GradeGPT

796 We also listed the prompts used by GradeGPT in
797 Tables 7.

798 C.3 Prompt For Cross-Lingual Prompting 799 and En-CoT

800 We have listed the specific prompts used for En-
801 CoT and Cross-Lingual Prompt during actual ex-
802 ecution in Table 11. Unlike the original Cross-
803 Lingual Prompt paper, for experimental simplicity,
804 we only adopted a single-turn format. However,
805 this suffices to illustrate the varying inferential
806 capabilities across different languages in current
807 LMMs.

808 D CMMaTH Dataset Details

809 D.1 Data Collection Details

810 To more clearly elucidate our data collection pro-
811 cess, we have depicted the overall pipeline of data
812 collection in Figure 7.

813 D.2 Knowledge Point Details

814 We provided detailed annotations of knowledge
815 points for our dataset and conducted preliminary
816 clustering of these knowledge points. The distri-
817 bution of knowledge points in different clusters
818 is as follows: We have formulated a Knowledge
819 Successful Solve Rate(SSR) as a structural metric
820 to gauge the proficiency level of multi-modal exten-
821 sive models in mastering knowledge points. N_{kn} is
822 the total number of knowledge point of CMMaTH.
823 Acc_{kn_i} is the $Acc_{outcome}$ of questions about i 'th
824 knowledge point. I denotes an indicator function.

$$SSR@\alpha = \frac{\sum_{i=1}^{N_{kn}} I(Acc_{kn_i} > \alpha)}{N_{kn}} \quad (1)$$

825 It is our contention that a knowledge point can
826 be deemed comprehensively understood only when
827 the accuracy rate of solving problems related to that
828 knowledge point surpasses a predefined threshold,
829 denoted as α . For the purpose of our investigation,
830 we have established α at the values of 0.1, 0.2, 0.3,
831 and 0.6 to demarcate the levels of mastery.

832 D.3 Characteristics Of Annotators

833 We utilized a standard team of four people, who
834 spent two weeks annotating the data. All annota-
835 tors have a university undergraduate education and
836 are well-versed in basic knowledge of the K12 edu-
837 cation field. To ensure quality, each question was
838 verified by at least two people.

839 E GradeGPT details

840 E.1 GradeGPT Prompt Detail

841 We have listed detailed Fewshot Examples using
842 the GPT4-generated GradeGPT model responses in
843 Table 11. Through this table, you can observe the
844 specific form of the Cross-Lingual-Judge-of-Chain
845 that we have used.

846 E.2 GradeGPT Performance Metric

847 GradeGPT performance evaluation metric is preci-
848 sion in comparison. We constructed a model that re-
849 sponds to a test set containing outputs from various
850 large models (including both correct and incorrect
851 model outputs). Each output is labeled as correct or

Element	Prompt
system-prompt	你是一个数学题解题助手，你的输入是一道数学题，以及这道题目的图像，你的任务是输出这道题目的求解思路以及答案。输出格式是一步一步的方式。
Example1	<p>Question: 小明有2000元，一个苹果2元，小明买了10个苹果。小明还有多少钱。 Model response: 首先计算小明买苹果的开销为2乘10等于20元。<STEP1> 用2000元减去所有的开销, 2000-20=1980元。<STEP2> 所以最终的答案为1980元。<STEP3></p> <p>Question: 如图，在$\triangle ABC$中，$\angle C=90^\circ$，$\angle B=30^\circ$，以A为圆心，任意长为半径画弧分别交AB、AC于点M和N，再分别以M、N为圆心，大于$\frac{1}{2}MN$的长为半径画弧，两弧交于点P，连结AP并延长交BC于点D，则下列说法中正确的个数是（）①AD是$\angle BAC$的平分线；②$\angle ADC=60^\circ$；③点D在AB的中垂线上；④$BD=2CD$. A.4 B.3 C.2 D.1 Model response: 首先确定$\triangle ABC$的几何性质。<STEP1>$\angle C=90^\circ$，$\angle B=30^\circ$，$\angle A=120^\circ$。<STEP2>$\triangle ABC$是一个等腰三角形。<STEP3>根据等腰三角形的性质，AD是$\angle BAC$的平分线。<STEP4>①AD是$\angle BAC$的平分线，正确。<STEP5>②$\angle ADC=60^\circ$，错误。<STEP6>③点D在AB的中垂线上，错误。<STEP7>④$BD=2CD$，正确。<STEP8>因此，正确的个数为4。<STEP9>答案为A.4。<STEP10>请你根据这个例子，解决下面的数学题。问题：在$\triangle ABC$中，$\angle C=90^\circ$，$\angle B=30^\circ$，以A为圆心，任意长为半径画弧分别交AB、AC于点M和N，再分别以M、N为圆心，大于$\frac{1}{2}MN$的长为半径画弧，两弧交于点P，连结AP并延长交BC于点D，则下列说法中正确的个数是（）①AD是$\angle BAC$的平分线；②$\angle ADC=60^\circ$；③点D在AB的中垂线上；④$BD=2CD$. A.4 B.3 C.2 D.1 求解步骤：首先确定$\triangle ABC$的几何性质。$\angle C=90^\circ$，$\angle B=30^\circ$，$\angle A=120^\circ$。$\triangle ABC$是一个等腰三角形。根据等腰三角形的性质，AD是$\angle BAC$的平分线。①AD是$\angle BAC$的平分线，正确。②$\angle ADC=60^\circ$，错误。③点D在AB的中垂线上，错误。④$BD=2CD$，正确。因此，正确的个数为4。答案为A.4。</p>
Example2	

Table 6: Prompt for all model to generate step-by-step answer.

Element	Prompt
system-prompt	<p>You are an answer evaluation assistant. Based on the following questions and reference answers, determine if the model's output is the same answer. When making the determination, please provide the analysis process in the following format. Note, for multiple-choice questions, it is only correct if the output includes all the corresponding options. (For example: If the reference answer is: A, C, and the model response is: C, the answer consistency is: No) Note, if the model response does not specify a particular option, and its correctness cannot be determined, the answer consistency should be: No.</p>
Example	<p>Question: 如图所示，AD是$\triangle ABC$的中线，点E在AC上，BE交AD于点F. 当$\frac{AF}{FD} = \frac{1}{2}$时，$\frac{AE}{AC} =$ Model Response: 首先，我们需要找到中线AD，然后找到点E在AC上的位置。找到中线AD，可以通过勾股定理求解，$AD^2 = AD \times AC^2$。设$AD = x$, $AC = y$, 则有$x^2 = xy^2$。<STEP1> 解这个方程，我们得到$y = \sqrt{x}$。现在我们知道点E在AC上，所以E的横坐标为y，纵坐标为x。 接下来，我们需要找到点F在BD上的位置。由于F点在BD上，我们可以设F点在BD的一半，即$F = (x + y)/2$。<STEP2> 现在我们可以计算AF和FD的长度。$AF = x - F$, $FD = FD - F$ 将已知的x和y代入公式，得到：$AF = x - (x + y)/2$, $FD = (x + y)/2 - (x + y)/2$ 简化得到：$AF = x - x/2 = x/2$ 这意味着$AF = FD$。<STEP3> 现在我们可以求解题目中的条件：$AE/AC = 1/2$ 将已知的AF和FD代入公式，得到：$AE/AC = (x - x/2)/(\sqrt{x})$ 化简得到：$AE/AC = 1/2$ 所以，答案为$AE/AC = 1/2$ <STEP4> Reference Response: $\frac{4\pi}{3} - 2\sqrt{3}$ Judge Result: The relevant paragraph in the Model Response that provides the answer is 所以，答案为$AE / AC = 1 / 2$。 Understand the question in Chinese. The Chinese model response means: Therefore, the answer is $AE / AC = 1 / 2$. Next, let's analyze whether the correct answer has been given. The reference answer $\frac{1}{5}$ is a numerical answer, and the output given in the model response is $1/2$. The consistency of the answers is: <No>.</p>

Table 7: Detail prompt for GradeGPT and it's instruction construction prompt by GPT4.

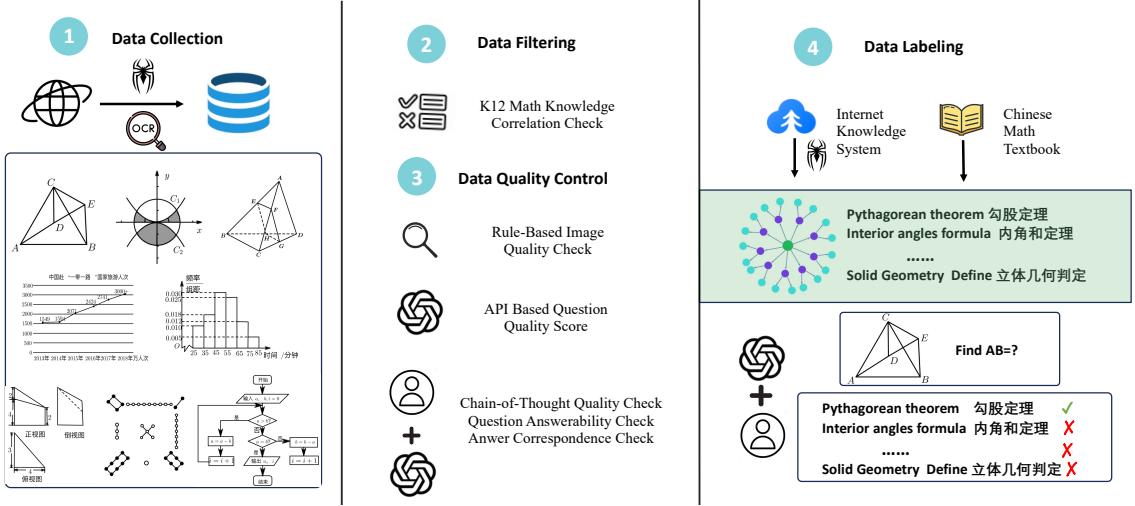

Figure 7: Overall Data Collection Pipeline of CMMaTH.

incorrect based on its result. GradeGPT is tasked with assessing whether the model responses are correct or incorrect, and this performance evaluation metric is a binary classification metric.

$$Acc_{outcome} = \frac{I(GradeGPT(R_i), Overcome_{GT})}{N_{response}} \times 100 \quad (2)$$

E.3 GradeGPT Training Details

We generated cross-lingual evaluation instruction pairs using the outputs from InternLM-XComposer, LLaVA-v1.5, CogAgent-18B and Yi-VL-34B. These outputs were produced using GPT-4 Fewshot. The generated evaluation instructions were filtered based on specific rules, retaining only those responses from GPT-4 that contained the fields: <Yes>/<No>. Ultimately, we constructed a cross-lingual format instruction set comprising 56k instruction pairs.

GradeGPT was trained on 8 H800, with the Qwen-14B-Chat version used as the base model. The model’s batch size was set to 16. The learning rate was set to 1e-4, and the gradient accumulation step was set to 16. It was trained for 10 epochs on a 40k bilingual Judge-of-Chain dataset. A detail example of instruction can refer to Figure 9.

E.4 Futher More Ablation Study

We conducted experiments on a development set comprising outputs from a 0.5k model. The development set was sampled from a subset of 0.5k questions on CMMaTH. Each question was accompanied by answers provided by GPT-4V, GPT-4o, and middle school students. Each answer was manually annotated to indicate whether it was correct.

LLM	$Acc_{outcome}$
Qwen-7B-Chat(4-Shot)	35.1
+Naive Outcome Finetune	51.5
+Judge-of-Chain	65.3
+Cross-Lingual-Judge-of-Chain	85.1
Qwen-14B-Chat(4-Shot)	43.7
GradeGPT(14B)	96.1
GPT4(4-Shot)	97.2

Table 8: Ablation study on the instruction fine-tuning of GradeGPT commands

We use 2 to measure the answer judgment capability of different LMMs, including Zershot LMMs and LLMs after Finetune.

Ablation On Instruction Format We conducted experiments on various instruction enhancement techniques used by GradeGPT and compared the results with GPT4 in Table 9. The results suggest that after various instruction enhancements, the accuracy of GradeGPT in model response judgment on CMMaTH can be improved to 96.1%, significantly surpassing the accuracy of GPT4. The proposed strategy can significantly enhance GradeGPT’s ability to judge results. It is only slightly weaker than the performance of GPT4(Fewshot) executed with a large number of examples. Our GradeGPT, as an open-source parameter model of approximately 14B, can serve as a stable, low-cost, and efficient alternative to GPT4.

The Baseline we compared, Qwen-7B/14B(4-Shot), GPT4(4-Shot), *Naive Outcome Finetune*, *Judge-of-Chain*. In the *Naive Outcome Finetune* format of instructions, the model is required to output its results indicating whether they are correct in

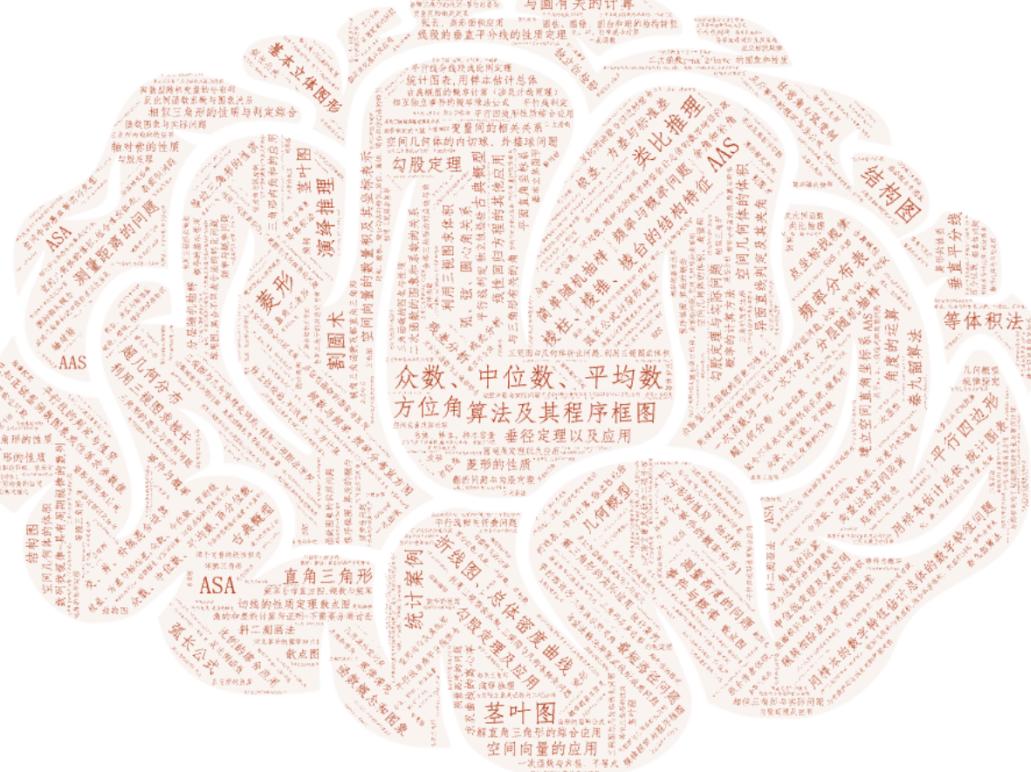

Figure 8: Cloud diagram of the knowledge points contained in the CMMaTH dataset.

the form of "<Yes>"/<No>". *Judge-of-Chain* also includes the understanding of results and natural language descriptions of model outputs, but does not include the part of extracting key Chinese outputs and translating them into English. Compared to having the language model directly predict the <Yes>/<No> judgment labels, directly using Chinese *Judge-of-Chain* to construct *Judge-of-Chain* improves the model's performance in answer evaluation. However, they didn't yield good results. The performance disparity may stem from an imbalance in the quality of Chinese and English components within some bilingual base models due to the training corpus.

Our findings show that fine-tuning with Cross-Lingual-Judge-of-Chain for detailed thought chain refinement significantly improves the performance of open-source models in outcome analysis tasks. Additionally, we discovered that using bilingual thought chains instead of Chinese-only thought chains for base model fine-tuning effectively enhances performance in outcome determination tasks. By using and synthesizing the instructions in the form of Cross-Lingual-Judge-of-Chain that we designed, we are able to efficiently distill the

Model Response Source	$Acc_{outcome}$

Instruction Example:**Role: System**

You are an answer evaluation assistant. Based on the following questions and reference answers, determine if the model's output is the same answer. When making the determination, please provide the analysis process. Note: for multiple-choice questions, it is only correct if the output includes all the corresponding options. Note: if the model response does not specify a particular option, and its correctness cannot be determined, the answer consistency should be: <No>.

Role: User

以下是某道题目，答案和一条模型响应。请确定模型响应中是否给出了正确的参考答案。

Question: 如图：若 $\Delta ABE \cong \Delta ACD$, $\angle A = 50^\circ$, $\angle C = 20^\circ$, 则 $\angle ADC = ?$.

Reference Answer: 110°

Model Response: 首先，我们需要了解这个问题的背景和目标。题目给出了三角形的三个角度，并要求我们找到另一个角度。我们可以用三角形的内角和来解决这个问题。首先，我们计算三角形的内角和： $\angle A + \angle B + \angle C = 180^\circ$ 。 $50^\circ + 20^\circ + \angle ADC = 180^\circ$ 。接下来，我们需要找到另一个角度，即 $\angle ADC$ 。我们可以通过将内角和减去已知角度来得到它： $\angle ADC = 180^\circ - \angle A - \angle B - \angle C$. $\angle ADC = 180^\circ - (50^\circ + 20^\circ)$. $\angle ADC = 180^\circ - 70^\circ$, $\angle ADC = 110^\circ$ 。所以，三角形 ΔABE 与 ΔACD 的另一个角度是 $\angle ADC=110^\circ$ 。

Judgment Result:

Role: Assistant

The relevant paragraph in the Model Response that provides the answer is
所以，三角形 ΔABE 与 ΔACD 的另一个角度是 $\angle ADC=110^\circ$

Understand the question in Chinese. The Chinese model response means: Therefore, another angle of triangle ΔABE and ΔACD is $\angle ADC = 110^\circ$.

Next, let's analyze whether the correct answer has been given. The reference answer 110° is a numerical answer, and the output given in the model response is 110° . The consistency of the answers is: <Yes>.

Figure 9: A instruction example to finetune GradeGPT.

Element	Prompt
system-prompt	You are a math problem-solving assistant. Your input is a math problem and an image of the problem. Your task is to provide the solution steps and the final answer. The output format should be step-by-step.
Example	<p>Question: Xiaoming has 2000 yuan, an apple costs 2 yuan, Xiaoming bought 10 apples. How much money does Xiaoming have left?</p> <p>Model response: First, calculate the cost of the apples Xiaoming bought, which is 2 times 10 equals 20 yuan. <STEP1> Subtract the total cost from 2000 yuan, $2000 - 20 = 1980$. <STEP2> So the final answer is 1980 yuan. <STEP3></p>

Table 10: Prompt for En-CoT in Our Cross-Lingual Experiment.

Element	Prompt
system-prompt	Please act as an expert in multi-lingual understanding in Chinese. After understanding, you should act as an expert in arithmetic reasoning in English. Let's resolve the task you understand above step-by-step! Finally, you should format your answer as 'Answer: [num]'.
Example	<p>Request: 玛丽比琼小两岁，琼比杰莎大五岁。如果杰莎20岁，这三个女孩的年龄总和是多少？</p> <p>Reason Result: Let's understand the task in English step-by-step! 1. "玛丽比琼小两岁" means "Mary is two years younger than Joan." 2. "琼比杰莎大五岁" means "Joan is five years older than Jessie." 3. "如果杰莎 20 岁" means "If Jessie is 20 years old." Then, Let's solve the task step-by-step: 1. According to the first sentence, Mary is two years younger than Joan. Let's suppose Joan's age is J, then Mary's age is J - 2. 2. According to the second sentence, Joan is five years older than Jessie. If Jessie's age is x, then Joan's age is x + 5. Answer: 68.</p>

Table 13: The hyperparameters for the models used in the evaluation are detailed. When the "comments" section includes the format *model = ""*, it signifies that the model was loaded from the transformer package. The vLLM package indicates that models are implemented by the vLLM package, where more details can be found in <https://github.com/vllm-project/vllm>. For models other than OpenAI's GPT, custom codes were utilized for evaluation unless specified otherwise in the comments.

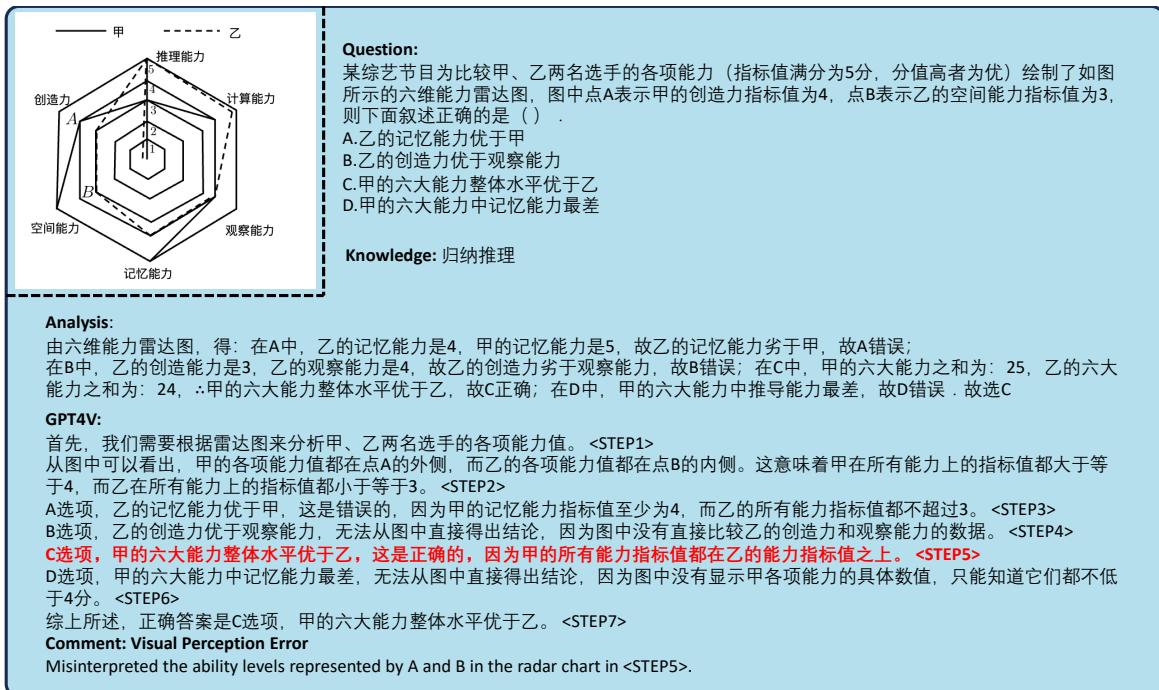

Figure 10: Case of GPT4V. The red ones are marked as generated inference hallucinations.

Question:

“悦跑圈”是一款基于社交型的跑步应用，用户通过该平台可查看自己某时间段的运动情况。某人根据2019年1月至2019年11月期间每月跑步的里程（单位：十公里）的数据绘制了下面的折线图。根据该折线图，下列结论正确的是（）。

- A. 月跑步里程逐月增加
- B. 月跑步里程最大值出现在9月
- C. 月跑步里程的中位数为8月份对应的里程数
- D. 1月至5月的月跑步里程相对于6月至11月波动性更小，变化比较平稳

Knowledge: 折线图、总体密度曲线

Analysis:

- A: 根据题意，依次分析选项：2月跑步里程比1月的小，7月跑步里程比6月的小，10月跑步里程比9月的小，故A错误；
- B: 月跑步里程9月最大，故B正确；
- C: 月跑步平均里程的月份从高到底依次为：9月，10月，11月，6月，5月，8月，1月，8月恰好在中间位置，故其中位数为8月份对应的里程数，故C正确；
- D: 1月至5月的月跑步平均里程相对于6月至11月，波动性更小，变化比较平稳，故D正确。

GPT4V:

求解步骤：首先观察折线图，可以看到每个月的跑步里程数。<STEP1>

A选项说月跑步里程逐月增加，但从图中可以看出，有些月份的里程数比前一个月少，所以A选项错误。<STEP2>

B选项说月跑步里程最大值出现在9月，从图中可以看到8月的里程数是最高的，所以B选项正确。<STEP3>

C选项说月跑步里程的中位数为8月份对应的里程数，由于共有11个月的数据，中位数应该是第6个月的数据，即6月份的数据，而不是8月份的数据，所以C选项错误。<STEP4>

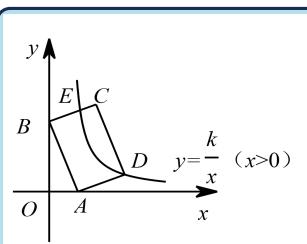

D选项说1月至5月的月跑步里程相对于6月至11月波动性更小，变化比较平稳，从图中可以看出1月至5月的数据变化确实比6月至11月的数据变化要小，所以D选项正确。<STEP5>

综上所述，正确的答案是D。<STEP6>

Misinterpreted the peak quantities represented in the line chart in <STEP3>.

Figure 11: Case of GPT4V. The red ones are marked as generated inference hallucinations.

Question:

如图，在平面直角坐标系中，矩形ABCD的边AB:BC = 3:2，点A(3, 0), B(0, 6)分别在x轴, y轴上，反比例函数 $y = \frac{k}{x}$ ($x > 0$) 的图象经过点D，且与边BC交于点E，则点E的坐标为？

Knowledge: 反比例函数

Analysis: 过点D作DF \perp x轴于点F，由同角的余角相等可得出 $\angle OBA = \angle FAD$ ，结合 $\angle AOB = \angle DFA = 90^\circ$ 可得出 $\triangle AOB \sim \triangle DFA$ ，根据相似三角形的性质结合点A、B的坐标，即可得出AF、DF的长度，进而可得出点D的坐标，再利用反比例函数图象上点的坐标特征即可求出k值，可得反比例函数解析式，由四边形ABCD是矩形，边BC可以看作是把边AD平移得到的，即可求得点C的坐标，即可求得BC所在直线的解析式，联立两函数解析式，解方程组，即可求解。

GPT4V: 首先，我们需要确定矩形ABCD的各个顶点的坐标。由于点A和点B的坐标已知，我们可以利用矩形的性质来确定点C和点D的坐标。
<STEP1> 由于AB:BC = 3:2，我们可以设AB的长度为 $3x$ ，BC的长度为 $2x$ 。因为点A的坐标为(3, 0)，点B的坐标为(0, 6)，所以AB的长度为6，BC的长度为4。所以 $x = 2$ 。<STEP2>

因此，点C的坐标为(0, 0)，点D的坐标为(3, -4)。<STEP3>

接下来，我们需要找到反比例函数 $y = k/x$ 的k值。由于图象经过点D，我们可以将点D的坐标代入函数中求解k。<STEP4>

代入点D的坐标(3, -4)得到 $-4 = k/3$ ，解得 $k = -12$ 。所以反比例函数为 $y = -12/x$ 。<STEP5>

最后，我们需要找到点E的坐标。由于点E在y轴上，所以它的x坐标为0。将x = 0代入反比例函数中，我们发现这是不可能的，因为反比例函数的定义域为 $x > 0$ 。因此，我们需要找到反比例函数与BC边的交点。<STEP6>

由于BC边在y轴上，其方程为 $x = 0$ 。但是反比例函数的定义域为 $x > 0$ ，所以它们不可能有交点。这里似乎有一个矛盾，因为题目中提到反比例函数与边BC交于点E。<STEP7>

我们重新审视题目，发现点E实际上是反比例函数与边CD的交点，而不是与边BC的交点。因此，我们需要找到反比例函数与边CD的交点。<STEP8>

边CD的方程为 $y = x - 4$ 。将反比例函数 $y = -12/x$ 代入得到 $-12/x = x - 4$ 。解这个方程得到 $x^2 - 4x + 12 = 0$ 。这是一个二次方程，我们可以用求根公式来解它。<STEP9>

解得 $x = 2 \pm \sqrt{4 - 12}$ ，这里判别式小于0，所以方程没有实数解。这意味着反比例函数与边CD实际上没有交点。<STEP10>

因此，根据题目描述，似乎存在一些错误或遗漏，因为根据给定的条件和函数，点E的坐标无法确定。我们需要更多信息或者更正题目描述才能找到点E的坐标。<STEP11>

Comment: Reason Error

In <STEP2>, the length of AB is not 6; it should be calculated using the Pythagorean theorem. The model didn't correctly invoke theorem knowledge.

Question: 张家口市为迎接冬奥会，计划招募各类志愿者2000人。为做好宣传工作，招募小组对20~45岁的人群随机抽取了100人，回答“冬奥会”的有关知识，根据统计结果制作了如下的统计图表1、表2，分别求出表2中的a、x的值。

组号	按年龄分组	回答完全正确人数	回答完全正确人数占本组频率
1	[20,25]	5	0.5
2	[25,30]	18	x
3	[30,35]	a	0.9
4	[35,40]	9	0.36
5	[40,45]	3	0.2

Knowledge: 众数、中位数、平均数、极差、方差与标准差、百分位数

GPT4V:

求解a和x的值：首先，我们需要理解表中的“回答完全正确人数占本组频率”这一列的含义。这个频率是指在该年龄组中回答完全正确的人数占该年龄组总人数的比例。对于a，我们知道在30~35岁组中的频率是0.9，这意味着在这个年龄组中，有90%的人回答完全正确。由于这个年龄组的总人数是100人的一部分，我们可以通过以下步骤求解a：设30~35岁组的总人数为b，则有 $a/b=0.9$ 。<STEP1>

由于总人数是100人，我们可以通过其他组的人数来计算b。<STEP2>

我们知道其他组的人数分别是：20~25岁组5人，25~30岁组未知，35~40岁组9人，40~45岁组3人。<STEP3>

所以 $b=100-(5+未知+9+3)$ 。<STEP4>

由于我们不知道25~30岁组的人数，我们需要先求出x。<STEP5>

对于x，我们知道在25~30岁组中的频率是x，这意味着在这个年龄组中，有 $x*100\%$ 的人回答完全正确。由于回答完全正确的人数是18，我们可以通以下步骤求解x：设25~30岁组的总人数为c，则有 $18/c=x$ 。<STEP6>

由于我们不知道c的具体数值，我们需要通过其他组的人数来计算c。<STEP7>

我们知道其他组的人数分别是：20~25岁组5人，30~35岁组未知，35~40岁组9人，40~45岁组3人。<STEP8>

所以 $c=100-(5+未知+9+3)$ 。<STEP9>由于未知的部分是30~35岁组的人数b，我们可以将c表示为 $c=100-(5+b+9+3)$ 。<STEP10>

现在我们有两个方程： $a/b=0.9$ 和 $18/c=x$ 。<STEP11>

我们可以通过解这两个方程来求解a和x。<STEP12>

由于我们知道 $b+c=100-(5+9+3)=83$ ，**我们可以将b表示为** $b=83-c$ 。<STEP13>

将b代入 $a/b=0.9$ 得到 $a=(0.9)(83-c)$ 。<STEP14>将c代入 $18/c=x$ 得到 $x=18/(83-a)$ 。<STEP15>现在我们有两个包含a和c的方程，我们可以通解这两个方程来求解a和x。<STEP16>由于 $a=(0.9)(83-c)$ ，我们可以将a表示为 $a=74.7-0.9c$ 。<STEP17>将a代入 $x=18/(83-a)$ 得到 $x=18/(83-(74.7-0.9c))$ 。<STEP18>解这个方程得到 $c=20$ ，所以 $x=18/20=0.9$ 。<STEP19>将c代入 $a=74.7-0.9c$ 得到 $a=74.7-0.9*20=56$ 。<STEP20> 所以a的值是56，x的值是0.9。

Comment: Reason Error
Misunderstanding of the concept of frequency and sampling. The sum of b and c does not equal 83.

Figure 16: Case of GPT4V. The red ones are marked as generated inference hallucinations.

Comment: Reason Error
Misunderstanding of the concept of frequency and sampling. The sum of b and c does not equal 83.

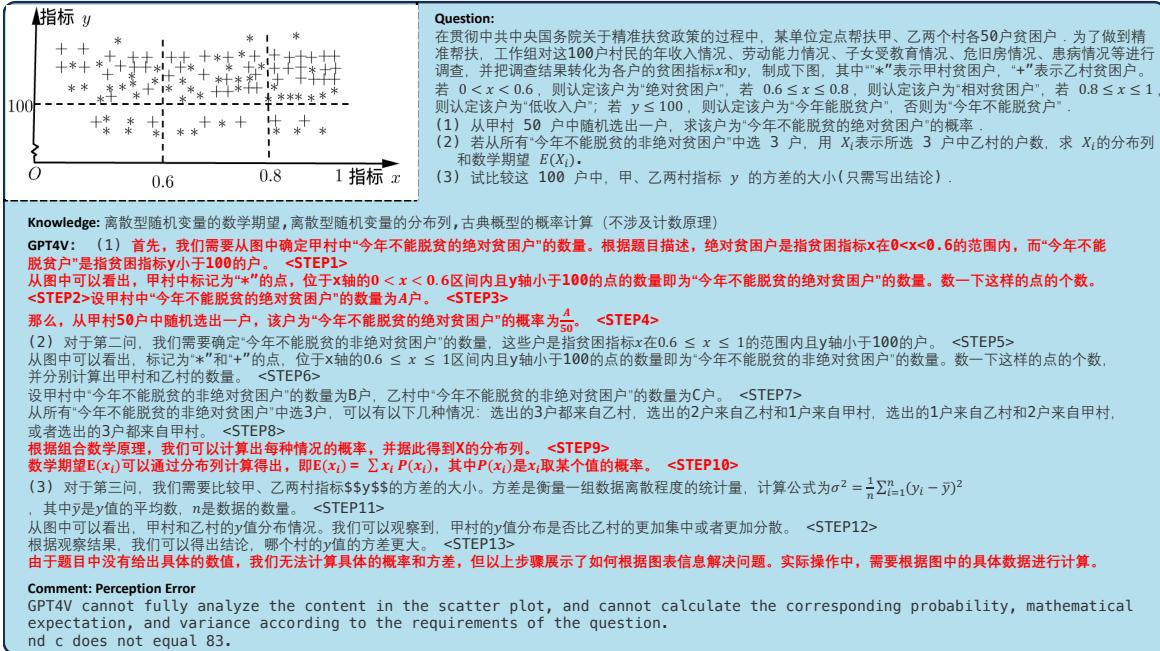

Figure 17: Case of GPT4V. The red ones are marked as generated inference hallucinations.

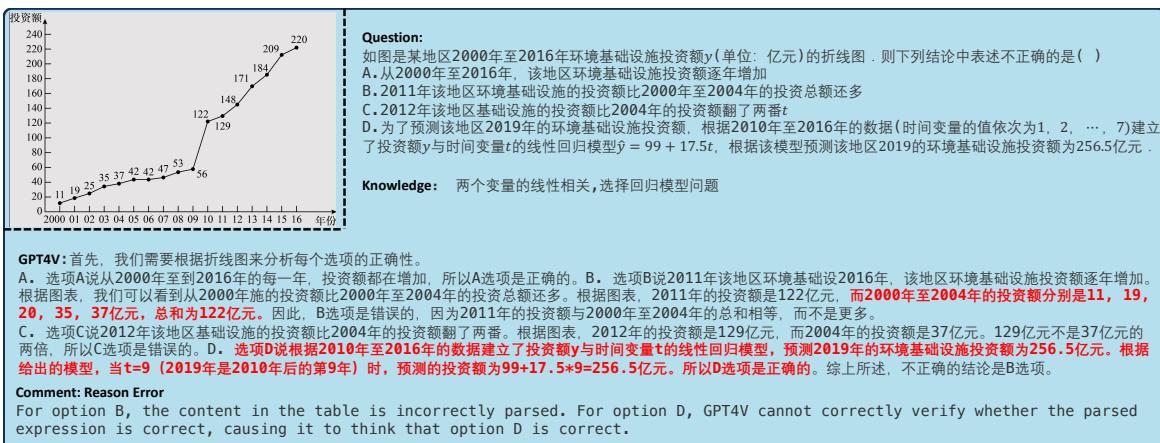

Figure 18: Case of GPT4V. The red ones are marked as generated inference hallucinations.

Question:
右图为某几何体的三视图，则该几何体外接球的表面积为（ ）。
 A. 17π
 B. 68π
 C. 13π
 D. 23π

Knowledge: 两个变量的线性相关，选择回归模型问题

GPT4V: 求解步骤：
首先观察三视图，可以看出这是一个直角三角形的棱柱，其底面直角三角形的两条直角边长分别为2和3。<STEP1>
 由于直角三角形的斜边是几何体的直径，我们可以使用勾股定理计算斜边的长度，即直径d。
 $d^2 = 2^2 + 3^2 = 4 + 9 = 13$ ，因此， $d = \sqrt{13}$ 。**<STEP2>**
 球的半径r是直径的一半，所以 $r = d/2 = \sqrt{13}/2$ 。**<STEP3>**
 球的表面积公式是 $4\pi r^2$ ，将r代入公式得到球的表面积 $S = 4\pi(\sqrt{13}/2)^2 = 4\pi(13/4) = 13\pi$ 。**<STEP4>**
 所以最终的答案为C. 13π 。**<STEP5>**

Comment: Reason Error
 GPT4V incorrectly infers the solid geometry as a triangular prism based on three views. In fact, the solid geometry is a triangular pyramid.

Question:
如图，将一个直角三角形纸片ABO，放置在平面直角坐标中，点A(-8,0)，点B(0,6)，点O(0,0)，C是OA上的点， $CD \perp AB$ ，沿着CD折叠该纸片，点A正好落在B处，则线段CD的长为？。

Knowledge: 轴对称，几何变换

GPT4V: 求解步骤：
 首先，我们需要找到点C的坐标。由于C在OA上，OA是x轴的一部分，所以C的y坐标是0。我们设C的x坐标为x。**<STEP1>**
 接下来，我们需要找到点D的坐标。由于CD垂直于AB，我们可以使用斜率的概念。直线AB的斜率是 $(6-0)/(0-(-8))=6/8=3/4$ 。因此，CD的斜率是 $-4/3$ （垂线段斜率的乘积为-1）。**<STEP2>**
 由于点D在AB上，我们可以用点斜式方程来表示直线AB： $y - 6 = (3/4)(x - 0)$ 。**<STEP3>**
 点D也在直线CD上，其方程可以表示为 $y - 0 = (-4/3)(x - x)$ ，其中x是点C的x坐标。**<STEP4>**
 由于点A在折叠后落在点B处，点D实际上是点A和点B的中点。因此，D的坐标是 $((-8+0)/2, (0+6)/2)=(-4, 3)$ 。**<STEP5>**
 现在我们有了点D的坐标，我们可以解出点C的x坐标。将D的坐标代入直线CD的方程中，我们得到 $3 = (-4/3)(-4 - x)$ 。解这个方程，我们得到 $x = -4 - (3/(-4/3)) = -4 + 3/(4/3) = -4 + 9/4 = -7/4$ 。**<STEP6>**
 因此，点C的坐标是 $(-7/4, 0)$ 。**<STEP7>**
 最后，我们可以计算CD的长度。由于C和D的y坐标相同，CD的长度就是D和C的x坐标之差的绝对值。所以CD的长度是 $|-4 - (-7/4)| = |(-16/4) + (7/4)| = |(-9/4)| = 9/4$ 。**<STEP8>**
 所以线段CD的长度是 $9/4$ 。**<STEP9>**

Comment: Perception Error
 Wrong perception of the slope of CD. The length of CD should be calculated using the distance formula between two points.

Figure 20: Case of GPT4V. The red ones are marked as generated inference hallucinations.

Question: 如图, 在边长为4的等边三角形ABC中, D, E分别是边BC, AC的中点, DF \perp AB于点F, 连结EF, 则EF的长为?

Knowledge: 等腰三角形的性质

GPT4V: 求解步骤:

首先, 由于D和E分别是边BC和AC的中点, 根据中线定理, DE的长度是BC的一半, 即 $DE=BC/2=4/2=2$. <STEP1>

接着, 因为三角形ABC是等边三角形, 所以 $AB=AC=BC=4$. <STEP2>

由于DF垂直于AB, 并且D是BC的中点, 所以F是AB的中点,

AF=FB=AB/2=4/2=2. <STEP3>

在直角三角形ADF中, 根据勾股定理, 我们有 $DF^2 = AD^2 - AF^2$.

<STEP4>

由于AD是等边三角形ABC的高, 可以通过勾股定理计算出AD的长度。在等边三角形中, 高也是中线, 所以 $AD=BD=CD$, 且 $AD^2 = AB^2 - (AB/2)^2 = 4^2 - (4/2)^2 = 16 - 4 = 12$. <STEP5>

因此, $DF = \sqrt{AD^2 - AF^2} = \sqrt{12 - 2^2} = \sqrt{12 - 4} = \sqrt{8} = 2\sqrt{2}$. <STEP6>

现在我们有了直角三角形DEF, 其中 $DE=2$, $DF=2\sqrt{2}$, 我们可以使用勾股定理来找到EF的长度。<STEP7>

$EF^2 = DE^2 + DF^2 = 2^2 + (2\sqrt{2})^2 = 4 + 8 = 12$.

<STEP8>

所以, $EF = \sqrt{12} = 2\sqrt{3}$. <STEP9>因此, EF的长度是 $2\sqrt{3}$.

<STEP10>

Comment: Reason Error
GPT4V misunderstood the role corresponding to point F. Point F is a vertical foot on AB rather than the midpoint.

Figure 21: Case of GPT4V. The red ones are marked as generated inference hallucinations.

Question: 已知全集 $U=R$, 集合 $A=\{x|0 \leq x \leq 2\}$, $B=\{x|x^2-x>0\}$, 则图中的阴影部分表示的集合为?

A. $\{x|x \leq 1 \text{ 或 } x > 2\}$
B. $\{x|x < 0 \text{ 或 } 1 < x < 2\}$
C. $\{x|1 \leq x < 2\}$
D. $\{x|1 < x \leq 2\}$

Knowledge: 集合的概念与表示方法

GPT4V: 求解步骤:

首先解集合B的不等式 $x^2 - x > 0$, 可以分解为 $x(x - 1) > 0$, 得到 $x > 1$ 或 $x < 0$. <STEP1>

集合A是从0到2的闭区间, 即 $0 \leq x \leq 2$. <STEP2>

图中阴影部分表示的是集合A和B的交集, 即 $A \cap B$. <STEP3>

根据集合A和B的定义, 交集部分是 $1 < x \leq 2$. <STEP4>

所以最终的答案是D. $\{x|1 < x \leq 2\}$. <STEP5>

Comment: Reason Error
Wrong understanding of the contents of the shaded part. The intersection of sets A and B does not represent the area of the shaded part.
