Paper under double-blind review

Abstract

Many existing evaluation benchmarks for Large Language Models (LLMs) quickly become outdated due to the emergence of new models and training data. These benchmarks also fall short in assessing how LLM performance changes over time, as they consist of static questions without a temporal dimension. To address these limitations, we propose using future event prediction as a continuous evaluation method to assess LLMs' temporal generalization and forecasting abilities. Our benchmark, Daily Oracle, automatically generates questionanswer (QA) pairs from daily news, challenging LLMs to predict "future" event outcomes. Our findings reveal that as pre-training data becomes outdated, LLM performance degrades over time. While Retrieval Augmented Generation (RAG) has the potential to enhance prediction accuracy, the performance degradation pattern persists, highlighting the need for continuous model updates.

1 INTRODUCTION

Traditional Large Language Model (LLM) benchmarks are often static, and do not reflect real-world information that evolves over time. This presents two significant challenges. First, as LLMs are updated, there is a risk that the static benchmarks become outdated and more vulnerable to data leakage, where their content might end up in the training data of newer models. This undermines the reliability of performance assessments on these benchmarks (Sainz et al., 2023; Xu et al., 2024; McIntosh et al., 2024; Li & Flanigan, 2024). Second, the static benchmarks often lack the temporal information to track the model's performance variations over time (McIntosh et al., 2024). This creates a need for evaluation methods that stay relevant over time and incorporate temporal dynamics.

033 Daily news provides a natural setting for continuous evaluation of LLMs. Since the world is con-034 stantly changing, a benchmark designed around forecasting the next day's news will never be out of date by construction. In addition to enabling continuous evaluation, forecasting is itself a longstand-036 ing challenge with significant implications across various domains, including healthcare, finance, 037 and policymaking (Tetlock & Gardner, 2016; Dempsey et al., 2017; Gillingham et al., 2018; Lopez-038 Lira & Tang, 2023). While human experts have traditionally made such forecasts, machine learning models, particularly LLMs, have emerged as promising alternatives due to their capability to learn from vast and diverse corpora (Halawi et al., 2024; Ye et al., 2024; Yan et al., 2023). Several recent 040 forecasting question-answer (QA) datasets have been developed (Jin et al., 2021; Zou et al., 2022; 041 Zhang et al., 2024), however, they are limited in either size, scope, or do not continuously keep pace 042 with the rapidly changing world. More critically, the extent to which LLMs' predictive abilities 043 change over time remains underexplored. 044

In this work, we propose Daily Oracle—a continuous evaluation benchmark that uses automatically
generated QA pairs from daily news to assess how the future prediction capabilities of LLMs evolve
over time. The QA pairs are generated on a daily basis, consisting of True/False (TF) and Multiple
Choice (MC) questions across various categories such as business, politics, and arts. Unlike traditional reading comprehension tasks, these QA pairs are designed to challenge LLMs to predict future
events based on their own existing knowledge, effectively evaluating their temporal generalization
and forecasting abilities.

We continuously evaluate various LLMs, both with and without access to a limited archive of news articles. Our experiments reveal that LLMs experience an average performance decline of 20.14% on True/False (TF) questions and 23.26% on Multiple Choice (MC) questions between January 2020 and September 2024, with degradation becoming more pronounced before and after the models'
 knowledge cutoff dates. Although models utilizing Retrieval Augmented Generation (RAG) (Lewis
 et al., 2020) can demonstrate improved prediction performance, the downward trend persists, suggesting an ongoing challenge in maintaining temporal generalization. Overall, our benchmark high lights the challenges posed by outdated pertaining data in LLMs, and underscores the necessity for
 continuous model updating to keep up with the constantly evolving stream of real-world information.

To summarize, our key contributions are two-fold:

- **Continuous Forecasting Evaluation Benchmark**: We present Daily Oracle, the largest and most up-to-date forecasting dataset, composed of automatically generated QA pairs. This benchmark continuously evaluates LLMs' temporal generalization and future prediction abilities using daily news, ensuring relevance over time and offering a challenging evaluation framework.
- Empirical Findings on Performance Degradation: Our experiments demonstrate a consistent decline in LLM prediction accuracy over time, even when supplemented with recent "open-book" information. The persistent degradation highlights the challenges posed by outdated pretraining data in LLMs and underscores the necessity for continuous model updating.

2 RELATED WORK

Temporal Generalization of LLMs. Lazaridou et al. (2021) define temporal generalization as the 074 ability of Language Models to generalize well to future data from beyond their training period. They 075 demonstrate that Transformer-XL's performance deteriorates over time, evidenced by increasing 076 perplexity when evaluated on post-training data. However, perplexity-based metrics have two main 077 limitations: they cannot be applied to closed-source models lacking accessible logits, and increased perplexity does not necessarily indicate degraded performance on downstream tasks (Röttger & 079 Pierrehumbert, 2021; Agarwal & Nenkova, 2022). Zhu et al. (2024) investigate temporal generation using the Bits Per Character (BPC) metric. Similar to perplexity, BPC fails to capture higher-level performance on downstream tasks. In contrast, our work focuses on evaluating how well models 081 acquire and utilize real-world event knowledge in downstream forecasting tasks, providing a more nuanced assessment of temporal generalization. 083

- 084 Dynamic QA Datasets. While static QA datasets evaluate models on fixed knowledge snapshots, 085 dynamic QA datasets incorporate a temporal dimension, allowing assessment of how models adapt 086 to evolving information. Several dynamic QA datasets are proposed. Chen et al. (2021) construct 087 TimeQA by using time-sensitive facts in WikiData with aligned Wikipedia passages to synthesize 880 QA pairs. Zhang & Choi (2021) introduce SituatedQA by manually annotating temporally and ge-089 ographically dependent questions. StreamingQA (Liska et al., 2022) and RealtimeQA (Kasai et al., 090 2024) are both dynamic benchmarks with QA pairs answerable from news articles. StreamingQA, 091 however, does not provide continuous evaluation with always-relevant data. RealTimeQA does not 092 address forecasting and is more like a plugin for a search engine, in the sense that it tests whether 093 a model has updated its knowledge as facts change, rather than testing whether it can predict what will change given its knowledge of the past. FreshQA (Vu et al., 2024) contains a fixed set of 094 human-written open-ended questions whose answers by nature can change based on new develop-095 ments in the world, but is smaller and does not address forecasting. It is also updated weekly rather 096 than daily. While all these datasets have some form of time-sensitivity like the Daily Oracle, they 097 either do not provide continuous evaluation or do not evaluate forecasting capabilities, or neither. 098
- 090

Forecasting Datasets. Forecasting questions aim to assess a model's ability to predict the out-100 comes of future events based on its existing knowledge. Several datasets in the event forecasting 101 field have been introduced. ForecastQA (Jin et al., 2021) used crowdworkers to collect 10,392 QA 102 pairs from news articles. Zou et al. (2022) argue that the QA pairs from ForecastQA are often non-103 sensical or ambiguous since they are written by humans without forecasting expertise. They further 104 introduce AutoCast, a forecasting dataset from popular human forecasting tournaments containing 105 6,707 QA pairs. In contrast, our Daily Oracle dataset is generated automatically from daily news articles, which means that it is never out of date, can easily grow its size automatically without addi-106 tional inputs from human forecasters, and provides more comprehensive event coverage than human 107 forecasting tournaments.

108	Dataset	Continuous?	Interval	Forecast?	Size	Latest Update
110	TimeQA	X	None	X	20,000	2021
110	SituatedQA	X	None	X	4,757	2021
	StreamingQA	X	None	X	36,800	2021
112	RealTimeQA	X	None	X	1,470	2023

118	Daily Oracle (Ours)	√	Daily	 ✓ 	29,988	2024

Table 1: We compare Daily Oracle with existing benchmarks in the literature. For continuously updated datasets (e.g. Daily Oracle, FreshBench, and FreshQA), "Interval" refers to the dataset update interval, and "Size" and "Latest Update" refer to the fixed data currently available. Our Daily Oracle benchmark is the only forecasting benchmark which is continuously updated every day using questions generated from daily news.

Similar to our generation method, TCELongBench (Zhang et al., 2024) has an automatic forecasting 126 QA generation framework using news articles. However, their TLB-forecast dataset is constrained 127 both temporally and topically, and only contains cooperation and conflict events in Middle-Eastern 128 countries from 2015 to 2022. This restricts the dataset from evaluating more general event-prediction 129 abilities. Furthermore, considering most of the powerful LLMs have been developed after 2020, 130 the portions of the dataset covering earlier years may contain answers already seen during training. 131 This prior exposure compromises the dataset's effectiveness as a forecasting benchmark. In contrast, 132 our dataset spans a broader timeframe and covers more topics, offering a more comprehensive and 133 reliable forecasting benchmark.

134 Note that none of the aforementioned datasets provide insights into how prediction ability changes 135 over time. Zhu et al. (2024) introduce FreshBench, a forecasting dataset scraped from the Good-136 JudgmentOpen platform, and also study temporal generalization. However, they report accuracy 137 in a relatively short time window (from January 2023 to April 2024) with only 2,532 questions. 138 While we observe a gradual performance decline in our dataset, they report significant fluctuations 139 in model accuracy shortly after release. We argue that our dataset presents a more challenging task, 140 as evidenced by the continuous degradation in model performance over time, making it a robust benchmark for assessing LLMs' temporal generalization. 141

In order to clearly showcase the differences between our dataset and prior work, we highlight a few key features in Table 1. The Daily Oracle is the only benchmark which is continuously updated on a daily basis and evaluates forecasting ability. Additionally, at the fixed size we use for analysis we provide significantly more evaluation examples than the other automatically updated benchmarks.

146 147

148

3 THE DAILY ORACLE DATASET

In this section, we present Daily Oracle, a continuously updated QA benchmark of forecasting 149 questions that are automatically generated from daily news. For our current analysis of LLM perfor-150 mance, we utilize a subset of the data consisting of 16,082 TF questions and 13,906 MC questions, 151 covering a diverse range of forecasting topics, which are generated using daily news articles from 152 January 2020 up until September 2024. However, our QA generation framework is continuous and 153 updates daily. In section 3.1, we describe our LLM-based dataset construction pipeline, detailing 154 the data sources and the four-step construction process. Section 3.2 provides an analysis and general 155 overview of the dataset. 156

156 157 158

3.1 DATASET CONSTRUCTION

Data Source. Following Zou et al. (2022), we collect a large corpus of news articles from the daily-updated Common Crawl News Dataset (Nagel, 2016) with the news-please package (Hamborg et al., 2017). We filter for mainstream sources—CBS News, CNBC, CNN, Forbes, and NPR. While our data collection and evaluation are performed daily, for this study we utilize a static

¹For news articles in 2019, we use them as the corpus for the constrained open-book setting. ²See Appendix C for all the prompts we use.

216 3.2 DATASET ANALYSIS 217

218 Summary Statistics. At the time of writing this paper, the subset dataset we use from Daily Oracle 219 consists of 16,082 TF and 13,906 MC QA pairs, covering the period from January 1st, 2020, to September 30th, 2024, with an average of 17.3 questions per day. Figure 1(b) shows that our dataset 220 covers various MC question types, mainly starting with "What will" (26.9%), "Who will" (21.0%), and "Which ... will" (18.4%). Figure 1(c) provides a breakdown of the categories, highlighting our 222 dataset's broad coverage. The categorization of each question is determined using GPT-3.5, based 223 on the prompt from Halawi et al. (2024). Examples of QA pairs are shown in Table 2. 224

250 251 252

249

225

253 Past and Future Information Usage. Each question in Daily Oracle implicitly requires the model 254 to retrieve relevant knowledge. How do these requirements change day by day over the course of 255 our benchmark? Anderson & Schooler (1991) study a similar relationship in human information environments, specifically in New York Times headlines, children's verbal interactions, and emails. 256 In Figure 2, we take inspiration from their work and analyze whether a word's frequency of occur-257 rence in the past 100 days predicts its occurrence on the next day. In other words, if over the past 258 100 days we have frequently required the model to retrieve specific knowledge, e.g. if there are 259 many questions about the unemployment rate, is it likely it will have to retrieve this knowledge in 260 the future? 261

We analyze this relationship for words in the titles of the articles we use to generate questions as 262 well as in the text of the TF and MC questions themselves. Past frequency is computed by checking, 263 for each day in the 100 day window, if a word has occurred in any article title (so, the maximum 264 frequency is 100). We find that there is a linear relationship between the frequency of usage in the 265 past 100 days and the probability of occurrence on the 101st day in all cases, replicating Anderson 266 & Schooler's findings for New York Times headlines. Interestingly, there is a drop in probability for 267 both TF and MC questions for words with a frequency of 40, though it is unclear why. There is also 268 some clustering at lower frequencies, particularly in the TF and MC question plots. Many words 269 appear less than 20 times during the 100 day window. The temporal structure exhibited in the daily news stream may be of a future point of interest from a modeling perspective.

Figure 2: Following Anderson & Schooler (1991), we plot the probability of a word occurring in an (left) article title, (middle) True/False question, or (right) Multiple Choice question given how frequently it had appeared in one over the past 100 days, computed over our entire dataset. We fit a linear regression in each case and show a linear relationship in each case ($R^2 = 0.978, 0.986$, and 0.985 for left, middle, and right respectively).

282

283

284

285

287

288

4.1 EXPERIMENTAL SETUP

Closed-Book Setting. We evaluate various LLMs on Daily Oracle to assess their understanding of real-world events and temporal generalization abilities, i.e., how accurately LLMs can answer forecasting questions based on the knowledge they learned from their training data. Our evaluation differentiates between two scenarios based on the question's resolution date and model's knowledge cutoff date: (1) *Pre-Knowledge Cutoff Questions:* These questions have resolution dates before the model's knowledge cutoff, testing the model's understanding of past events. (2) *Post-Knowledge Cutoff Questions:* These have resolution dates after the knowledge cutoff, requiring models to predict future events and test their forecasting and temporal generalization abilities.

297 Constrained Open-Book Setting. In addition to a closed-book evaluation, we explore the con-298 strained open-book setting: how access to news articles up to different time cutoffs influences LLM 299 performance using RAG (Lewis et al., 2020). We introduce the concept of the RAG cutoff (R-300 *Cutoff*), which limits the latest accessible date for retrieving articles. To prevent the models from 301 leveraging information beyond the resolution date, for any question with a resolution date (d_{res}), 302 the accessible articles span from January 1st, 2019 (the start of our news corpus) up to whichever comes first between the day before the resolution date and the RAG cutoff date ($d_{\text{R-Cutoff}}$). Formally, 303 the accessible date range is $[01/01/2019, \min(d_{\text{res}} - 1, d_{\text{R-Cutoff}})]$. Following prior work (Jin et al., 304 2021; Zou et al., 2022; Zhang et al., 2024), we employ BM25 (Robertson et al., 1995) as the re-305 triever and select the top 5 articles relevant to each question. We truncate each retrieved article to a 306 maximum length of 512 words. These articles are then incorporated into the input prompts to serve 307 as additional information. 308

Gold Article Setting. We further include a setting where models are provided direct access to
 the gold article, from which the question is generated. This transforms the forecasting questions
 into reading comprehension ones, which can also access LLMs' general question-answering capabilities. Achieving high accuracy here ensures that the questions from our Daily Oracle dataset are
 answerable.

Metrics. Accuracy score is used as the evaluation metric. Though LLMs are tested daily, to show clearer trends, we plot the monthly performance in Figure 3, and apply a 5-month moving average to smooth the curve. We also report yearly averages and average year-over-year (YoY) accuracy change before and after models' knowledge cutoff dates in Table 3. Additionally, despite prompting the models to avoid responses like "I cannot predict the future" and instead provide definitive answers, there are cases where such refusals still occur. The rejection rates are provided in the Appendix B.2, and these cases are counted as incorrect to ensure comparability across model results.

- 320
- 4.2 MAIN RESULTS
- **Results for the Closed-Book Setting.** Figure 3 and Table 3 present our primary results for the closed-book setting. The "Avg" column in Table 3 shows the average YoY accuracy change of all

months, revealing a clear degradation in performance over time across all models on both TF and
MC questions. When comparing accuracies from the beginning to the end of the evaluation period,
we observe that, on average, the models' performance declines by 20.14% on TF questions (from
64.68% to 51.65%) and by 23.26% on MC questions (from 58.30% to 44.74%). This indicates that
while LLMs demonstrate certain abilities to understand real-world events and make predictions, they
struggle to maintain these abilities.

Figure 3: Results for the closed-book setting. We plot the 5-month moving average accuracy for True/False (TF) and Multiple Choice (MC) questions across different LLMs.

Notably, the average YoY accuracy declines provide further insight. Before the knowledge cutoff, the average YoY decline across all models was relatively moderate. However, post-knowledge cutoff, we observe steeper declines in many models, with GPT-4 showing the most drastic drop in MC performance, declining by 18.47%, compared to just 4.23% before the cutoff. This contrast highlights that while LLMs manage to retain a baseline of past knowledge with small degradation, their ability to forecast future events deteriorates much more rapidly as they move beyond their training data, struggling with temporal generalization.

Among different models, Claude-3.5-Sonnet (Anthropic, 2024) significantly outperforms all others, while GPT-4 excels in MC questions but its performance in TF is not as remarkable as in MC. GPT-3.5, Qwen-2-7B (Yang et al., 2024) and Llama-3-8B (Dubey et al., 2024) show smaller temporal declines than GPT-4 in both TF and MC questions. Interestingly, Mistral-7B (Jiang et al., 2023) and Mixtral-8x7B (Jiang et al., 2024) show the most pronounced drops in TF accuracy, with scores falling below the random baseline 50% due to increased answer refusals, as shown in the Appendix B.2. Gemma-2-2B (Team et al., 2024) exhibits the most consistent performance with the smallest average YoY decline, likely due to its more recent knowledge cutoff date.

Results for the Constrained Open-Book Setting. In Figure 4, we present the results of the con-strained open-book setting, with Mixtral-8x7B on TF questions and Llama-3-8B on MC questions across different RAG cutoff dates.³ For Mixtral-8x7B, as the RAG cutoff dates extend to closer to the resolution dates, we observe a clear improvement in performance, indicating the model ben-efits from increasingly updated information retrieval. However, there are noticeable performance drops immediately after each RAG cutoff date when compared to providing information up to the day before the resolution date (with the exception of the March 2024 cutoff). This highlights the importance of keeping up-to-date information for optimal RAG performance. Interestingly, RAG does not uniformly enhance performance. Llama-3-8B may perform worse than the closed-book setting when the RAG cutoff is prior to the knowledge cutoff dates, suggesting outdated informa-tion may negatively impact performance. Conversely, for more recent RAG cutoff dates that extend beyond the knowledge cutoff, significant performance improvements are observed (as illustrated by the curves with cutoffs in September 2023 and March 2024). Notably, across all different RAG cut-offs, the overall performance decline pattern persists, likely due to outdated internal representations and the model's inherent knowledge limitations.

³Refer to Appendix B.4 for results of other models in the constrained open-book setting.

Table 3: For various LLMs with different knowledge cutoffs (K-Cutoffs), we show the yearly aver-age accuracy (calculated as the average across months) from 2020 to 2024, along with the average year-over-year (YoY) accuracy change (%) before the knowledge cutoff date (Pre-Cutoff), after the knowledge cutoff date (Post-Cutoff), and the overall average YoY accuracy change across all months (Avg) on the Daily Oracle dataset.

Figure 4: Results for the constrained open-book setting, evaluating Mixtral-8x7B on TF questions and Llama-3-8B on MC questions with different RAG cutoff dates.

38!

Results for the Gold Article Setting. Figure 5 shows that when given access to the gold articles from which the questions are generated, LLM performance can be improved significantly to around 90%, demonstrating the answerability of Daily Oracle.⁴ However, most of the models still show declining trends. This is noteworthy because, ideally, LLMs are expected to achieve consistent accuracy regardless of the article's publication date when answers are directly accessible. However, the outdated representations hinder their ability to consistently generate correct answers, even in a reading comprehension setting.

4.3 DISCUSSION

LLMs' Performance Evolution Across Time. We observe several LLMs' performance evolution patterns in Figure 3: (1) Gradual Decline in the Recent Past: In the months before the knowledge cutoff date, which we call the *recent past*, we observe a gradual decline in model performance, as seen in Llama-3-8B, GPT-4, and Claude-3.5-Sonnet, likely due to a lack of representation of recent news in the training data. (2) Rapid Decline in the Near Future: In the near future, which we define as the months following a model's knowledge cutoff date, sharp performance drops are observed in several models in MC questions. For instance, the decline in Claude-3.5-Sonnet and

⁴Results for GPT-3.5 are provided and discussed in Appendix B.3, as this older model performs relatively poorly and including it on the same scale would obscure the trends of other models.

465

Figure 5: Results for the Gold Article Setting. Most of the models struggle with temporal generalization, even when provided with gold articles containing the answers.

448 GPT-4 accelerates soon after their knowledge cutoffs. Most of the models, however, do not lose all 449 the predictive power at once, as evidenced by the further decline into the farther future.

450 We explore this further by analyzing the slope of accuracy as a function of time. In Figure 6, we show 451 how the slope changes as we fit a regression to an increasingly larger window of data, until we reach the full set of accuracies. Specifically, using the 5-month moving average of each model's accuracy 452 on MC questions (visualized in Figure 3), we start by fitting a linear regression line on the first 10 453 months of data. We then add an additional month and compute a new regression on the larger win-454 dow, repeating until we reach the final month, and applying an exponential decay weighting to past 455 data to reduce the influence of distant observations. With this, we can analyze how the slope of our 456 regression line changes as each month is added to the data. The slope in each case is negative after 457 the cutoff data and for Claude-3.5-Sonnet, GPT-4, and Llama-3-8B, the slope eventually or immedi-458 ately becomes more negative than it was at any point preceding the cutoff. Both Claude-3.5-Sonnet 459 and Llama-3-8B have a crossover from positive to negative slope in late summer 2022, July and 460 August, respectively, while GPT-4's seems to occur slightly earlier, in March of 2022. For GPT-3.5, 461 GPT-4, and Llama-3-8B, the slope becomes increasingly negative not long after the knowledge cut-462 off, giving evidence for a rapid decline in the *near future*. Likewise, the period preceding the cutoff 463 shows a less negative slope and in some cases, most obviously in the case of GPT-3.5 and Llama-3-8B, a slightly negative but consistent slope, in other words, a gradual decline in the recent past. 464

Need for Continuous Pretraining. The overall decline trend may come from two sources, the
 missing knowledge of future and a lack of up-to-date language representation. While the lack of
 knowledge can be partially recovered with information retrieval as shown in the constrained open book setting, the gold article setting provides an "upper bound" of open-book retrieval. When
 provided the gold articles, the remaining decline in the model's performance suggests continuous
 pre-training of LLMs (Jang et al., 2022; Jin et al., 2022; Ke et al., 2022a;b; Yıldız et al., 2024) is
 still needed in the context of news event forecasting to address outdated representations.

TF & MC Comparison. All models except for Claude-3.5-Sonnet struggle with TF questions,
where the degradation trends towards the random baseline accuracy of 50%, indicating that predicting if a future event will happen or not can be sometimes challenging for LLMs. In contrast, on MC questions, models tend to perform much better than the random baseline at 25%. There are two potential reasons that can explain the disparity. First, TF questions can be considered more open-ended than MC because the "No" answer contains other possible open-ended outcomes. Second, since the distractor choices are created by an LLM, they may not be as likely to happen as the true answer.

Consistent Performance Decline After September 2021. Interestingly, Figure 3 reveals a higher
rate of performance decline around September 2021, which is the knowledge cutoff date of GPT3.5, across all models, particularly for MC questions. In contrast, performance remains relatively
stable prior to this date. We hypothesize that this trend arises because the period up to September
2021 may be overrepresented in many pretraining corpora (Raffel et al., 2020; Gao et al., 2020;
Kobayashi, 2018; Gokaslan & Cohen, 2019; Zhu, 2015; Rae et al., 2019; Tiedemann, 2016; Saxton et al., 2019), compared to more recent periods. Another potential cause of this imbalance is an

Figure 6: Coefficients for regressing accuracy on the MC questions against time, as the number of months grows. Using an initial window of 10 months, we progressively add data for additional months to our regression and plot the coefficient (slope) for the regression of accuracy against time. For our regression, we use the moving average of accuracy and apply exponentially decaying weights to older months (i.e. given a window of k months, we weight x_t with λ^{k-t} ; in this case $\lambda = 0.995$). In each case, the slope becomes more negative following the knowledge cutoff period compared to the months immediately preceding it.

increasing number of websites restricting access to web crawlers (Longpre et al., 2024) after the rise of ChatGPT.

515 **Limitations.** On the data generation side, the generated questions as well as the distractor answers could contain biases from an outdated LLM, making the benchmark less reliable in the long run 516 unless we upgrade the models. Additionally, generating questions from news articles can introduce 517 bias by focusing only on events that have definitively occurred or not occurred. This approach 518 overlooks speculative events, which may be of interest in forecasting questions but may not be 519 covered in news articles, limiting the scope of the dataset. On the evaluation side, our paper proposes 520 the continuous evaluation benchmark but at the time of the writing there isn't a long enough time 521 horizon on each model, especially after the cutoff dates, for a thorough analysis. Ideally, we would 522 like to analyze the relation between the effect of knowledge and RAG cutoff dates but the trend 523 seems to be weak within the time horizon available. 524

525 5 CONCLUSION AND FUTURE WORK

535

527 We introduce Daily Oracle, a continuously updated QA benchmark leveraging daily news to evaluate the temporal generalization and future prediction capabilities of LLMs. Our experiments reveal 528 that while LLMs maintain a degree of predictive power over future events, their prediction accu-529 racy exhibits a gradual decline over time across various models. Notably, while the stronger model 530 Claude-3.5-Sonnet outperforms others significantly, it still exhibits around 12% performance drop 531 in its post-knowledge cutoff period. Although RAG mitigates the effect of outdated knowledge, 532 a noticeable decline in performance remains. Our findings underscore the necessity for ongoing 533 model updates with more current information and emphasize the importance of disentangling miss-534 ing knowledge from the lack of up-to-date representations.

We hope this work will draw attention to the need for more practical applications of the continuous training of LLMs, driving advancements in adapting models to real-time data changes. In the future, alongside maintaining Daily Oracle, we plan to incorporate a broader range of models and explore how continuous pre-training and efficient adaptation can address the performance degradation challenges presented in our work.

APPENDIX

A DATASET DETAILS

A.1 DETAILS FOR ARTICLE SELECTION

We select daily articles that generate the QA pairs in two ways: (1) Random Selection: We randomly sample three articles each day. (2) Hot Topic Selection: To better capture daily events and reduce noise, we select three articles from the top three hot topics of the day. We identify these hot topics by applying the density-based clustering algorithm DBSCAN (Ester et al., 1996) to the new articles based on TF-IDF (Term Frequency-Inverse Document Frequency) representations, forming clusters of news articles for each day. We filter out chaotic clusters by removing those with low average in-cluster cosine similarity scores, which typically correspond to clusters containing a large number of diverse articles. The top three clusters, determined by size, are assumed to represent the most discussed events, i.e. hot topics, since larger clusters indicate more articles covering the same event. One article is picked randomly from each of the top three clusters.

A.2 QA FILTERING PRINCIPLES

Seven principles of QA Filtering step in the data construction process: (1) Correctness of Answers: The answer must be factually accurate and fully aligned with the information in the given article. (2) *Non-answerability Before the Publication Date:* Since we treat the article's publication date as the question's resolution date, the question should not be definitively answerable based on information available before the article's publication. (3) Absence of Information Leakage: Questions must avoid revealing information that became known only after the article's publication, maintaining fairness for pre-publication evaluation. (4) Objectivity: Both questions and answers must rely on objective facts, avoiding subjective ideas from the authors. (5) Inclusion of a Clear Temporal Element: Questions must contain a specific and clear reference to time, avoiding vague phrases like "in the future" or "soon." (6) Public Interest: The questions should address topics of broad public concern. (7) Non-obviousness of the Answer: The answer should not be immediately predictable from the question and must provide new or non-trivial insights.

A.3 QA FILTERING RESULTS

We generate a total of 37,775 QA pairs, of which 29,988 (79.39%) pass our *QA Filtering* step. This filtering process retains pairs having at most a one-point deduction, i.e. a minimum total score of 13 points. The score distribution for each principle during the *QA Filtering* step is illustrated in Figure 7. Additionally, the average scores across the seven principles in the final dataset are presented in Figure 8.

Figure 8: Average scores for the seven principles in our final dataset.

A.4 **QUESTION OVERLAPPING RATE**

The overlap rate across our questions is low, since for each question type, a maximum of two questions are derived from any single article. To further analyze this, we utilized the Sentence Transformer model "all-MiniLM-L6-v2" (Reimers & Gurevych, 2019) to get the sentence embeddings and then compute cosine similarity scores for the question pairs. We plot the distribution in Figure 9. Among the TF questions, the average cosine similarity score is 0.23, and for the MC questions, the average score is 0.20. The proportion of similarity scores greater than 0.5 is only 0.68% for TF questions and 0.56% for MC questions.

Figure 9: Distribution of the cosine similarity scores among our questions.

В **EXPERIMENT DETAILS**

B.1 **BASELINE MODELS INFORMATION**

Table 4 lists the LLM model versions used in our experiments.

B.2 REJECTION RATES IN THE CLOSED-BOOK SETTING

Figure 10 shows the rejection rates for the closed-book setting. We can see that the rejection rate increases throughout the time for Mistral-7B in TF questions and Mixtral-8x7B in both TF and MC questions. This high rejection rate in TF questions for these two models results in closed-book performance dropping below the random baseline of 50% in certain months, as shown in Figure 3.

Table 4: Baseline Model Versions.

Figure 10: Rejection rates for the closed-book setting. We plot the 5-month moving average rejection rates for True/False (TF) and Multiple Choice (MC) questions across different LLMs.

B.3 RESULTS FOR GPT-3.5 IN THE GOLD ARTICLE SETTING

To more effectively illustrate the trends of other models at a suitable scale, we display GPT-3.5's performance in the gold article setting separately. As shown in Figure 11, this outdated model performs relatively poorly throughout. While its accuracy could improve with chain-of-thought prompting (Wei et al., 2022), we report its performance using the same prompt format as the other models for consistency in comparison. Nevertheless, a clear downward trend is observed in MC questions.

Figure 11: Results for GPT-3.5 in the Gold Article Setting. Compared to other models achieving
around 0.9 accuracy, GPT-3.5 performs worse in both MC questions and, more notably, in TF questions.

918 B.4 MORE RESULTS IN THE CONSTRAINT OPEN-BOOK SETTING

Figures 12, 13, 14, 15, 16, 17, and 18 show the constrained open-book evaluation results for more
models. Similar patterns are observed as discussed in Section 4.2. Specifically, for Claude-3.5Sonnet, the constrained open-book performance lags behind its closed-book performance, likely
because it already has robust representations of world events, making RAG less effective. Additionally, GPT-3.5 is not included in the constrained open-book setting due to its unexpectedly poor
performance in the gold article setting (Figure 11) and budget limitations.

Figure 12: Results for Claude-3.5-Sonnet in the constrained open-book setting.

Figure 14: Results for Mixtral-8x7B in the constrained open-book setting.

B.5 ANALYSIS FOR THE CONSTRAINT OPEN-BOOK SETTING RESULTS

v2" (Reimers & Gurevych, 2019) to get the embeddings. We then compute the average cosine similarity score between each question and its corresponding articles, yielding an overall average score of 0.49. The distribution of these scores is presented in Figure 19.

Article Recency Analysis: In Figure 20, we show the average date difference between the question date and the publishing dates of the retrieved articles across different RAG cutoffs. The results demonstrate that as the RAG cutoff moves forward in time, the BM25 retriever on average would retrieve newer articles from the question date. In other words, our RAG cutoff does impact retrieval behavior.

1017

Moreover, to analyze the correlation between article recency and model performance, we present a case study that visualizes the relationship between article recency and model performance. In this analysis, we select the Mixtral-8x7B model with an RAG cutoff of September 2023. We calculate the average date difference as the mean temporal gap between a question and its top 5 retrieved

All the prompts we use are shown in this section. The QA generation prompts and evaluation prompts are adapted from Zhang et al. (2024), and the prompt to categorize our generated questions is taken from Halawi et al. (2024).

1134	Nova Anticle]
1135	Title: DFL leaders. Minneapolis announce deal on rideshare pay, but Lyft and Uber say they will leave
1136	Publishing Date: 2024-05-06
1137	Text: ST. PAUL, Minn. — Key lawmakers and DFL legislative leaders on Monday announced that they
1138	have a compromise on statewide rideshare regulations in Minnesota, but Uber and Lyft quickly rejected
1139	the plan and said that they will still exit the market if the proposal becomes law.
1140	The amendment, which will be heard in a House committee Tuesday, includes a minimum wage pay rate
1141	of \$1.27 per mile and 49 cents per minute. Leaders said they worked with the Minneapolis City Council
1142	on finding compromise, but the companies were not included in the negotiations.
1143	The proposal is lower than the Minneapolis rate of \$1.40 per mile and \$0.49 per minute, but higher than
1144	study done by the Minnesota Department of Labor and Industry, which determined \$0.89 mile and \$0.49
1145	for the Twin Cities metro would bring driver pay up to the cityś minimum wage of \$15.57 an hour.
1140	"This was a really his mays for the Minneepolis City Council. This is seming down 12 cents from the
1147	rate that they passed. And this is consistent with the rates that Uber and Lyft are operating with and other
1140	states and other jurisdictions," House Majority Leader Jamie Long, DFL-Minneapolis, who was a key
1149	negotiator, told reporters. "We know that the companies have said the same thing in other states. They've
1151	said that they were going to leave at certain rates, and they've stayed and been able to operate profitably."
1152	Uber and Lyft quickly responded that they will still plan to leave Minneapolis — as they said would
1153	happen on July 1, when the city's ordinance is effective — and the state if this becomes law.
1154	
1155	
1156	Ouestion: What will be the response from Uber and Lyft if the proposed rideshare regulations become
1157	law in Minnesota by May 2024?
1158	Answer: (a) They will plan to leave the market.
1159	Misleading Choices:
1160	(c) They will collaborate to develop an alternative service model
1161	(d) They will reduce their services rather than exit.
1162	
1163	[Closed-Book Setting]
1164	• The question is asked directly to Mixtral-8x/B.
1165	• Model response: (wrong) "(d) They will reduce their services rather than exit. This is because leaving
1166	the market entirely can be a drastic move and may not be the first response to new regulations. Reducing services is a more likely response, as it allows rideshare companies to comply with the new laws while
1167	still maintaining a presence in the market. Additionally, they may also try to negotiate or influence the
1168	regulations before they become law."
1169	[Constraint-Open Book Setting]
1170	• The RAG-cutoff refers to the latest accessible date for retrieving articles. With RAG-cutoff = 2024-
1179	03-01, we extracted the top 5 relevant articles (here, only the titles are displayed, but the articles are
1173	included in the evaluation prompt):
1174	- (2023-05-25) Uber Threatens To Cut Most Service In Minnesota If Minimum Pay Law Takes
1175	Effect
1176	- (2023-05-25) Minnesota Governor Vetoes Rideshare Minimum Pay Bill After Über Threatens To
1177	- (2023-08-09) Minneanolis City Council moving towards minimum wage for rideshare drivers
1178	 (2024-02-27) Minneapolis City Council to consider rideshare minimum wage ordinance Tuesday
1179	- (2024-01-11) Some Lyft. Uber drivers to strike Thursday at MSP Airport
1180	• Model response: (correct) "(a) They will plan to leave the market"
1181	• Model response. (confect) (a) They will plan to reave the market.
1182	[Gold Article Setting]
1183	• In the gold article setting, models are provided direct access to the gold article, from which the question
1184	is generated. The question them is treated as a reading comprehensive question rather than a forecasting question.
1185	 Model response: (correct) "(a) They will plan to leave the market "
1186	- model response. (contect) (a) they will plan to reave the market.
1107

1190	
1191	
1192	You are an expert in extracting summary and keypoint from articles.
1193	
1194	#Rules
1195	1. Provide a comprehensive summary of the entire article in one paragraph, ensuring that all essential
1196	statements to fully convey the context and content of the news story
1197	2. Please provide one keypoint that summarizes the new event from the article with the following rules:
1198	- Focus specifically on events that are newly occurring on the publication date of the article. If the article
1199	does not introduce a new event but instead discusses ongoing topics or is about non-news content like
1200	advertisements, state 'No new event reported.'
1201	- The point should be concise, accurate and complete, especially for numbers, names and dates.
1202	referencing in the point.
1203	- You are not allowed to start with any of the phrases: the article discusses, the article shows, the article
1204	emphasizes, the article discusses, the speaker says, the speaker discusses, the author mentions, etc.
1205	
1206	# Examples Here are several examples of extracting keypoints from articles. Note that the articles in different
1207	examples are irrelevant
1208	## Example 1:
1209	Article: Professional golfer Lexi Thompson has announced her retirement from professional golf at
1210	the end of the 2024 season at the age of 29. Thompson, an 11-time LPGA Tour champion, made the
1211	announcement ahead of her 18th consecutive US Women's Open appearance. She turned professional in 2010 and won her first major at the 2014 Kraft Nabisco Championship. Despite enduring injuries that
1212	led to a drop in her world ranking. Thompson continued to compete at a high level. In her retirement
1213	announcement, Thompson expressed gratitude for the opportunities golf provided her and highlighted
1214	her excitement for the next chapter of her life.
1215	Publishing Date: 2024-05-29, Wednesday
1216	Keypoint: Lexi Thompson announced her retirement from professional golf at the end of the 2024 season at the age of 20
1217	at the age of 23.
1218	## Example 2:
1219	Article: India's capital territory of Delhi sweltered to its highest-ever temperature of 49.9 degrees Celsius
1220	(121.8 degrees Fahrenheit) on Tuesday, as an oppressive heat wave forced authorities to impose water
1221	rationing.
1222	The Indian Meteorological Department (IMD) said the new record was measured in the suburb of
1223	Mungeshpur, surpassing Delhi's previous high of 49.2 degrees Celsius (120.5 degrees Fahrenheit),
1224	observed in May 2022.
1225	Publishing Date: 2024-05-29, Wednesday Kaupoint: Dalbi experienced its highest over temperature of 40.0 decrees Calcius on 2024.05-29
1226	Thesday.
1227	- wooduj.
1228	# New Article
1229	Based on the provided rules and examples, please summarize the article and identify one key point that
1230	concludes the new event on the publishing date.
1231	Autore. {} Publishing Date: {}

1239	

1242 1243 1244 1245 1246 1247 [Setup:] Today is {}. You will be testing people who are from the past, i.e. a week or a month ago. 1248 A recently published article will serve as the basis for your questioning. Your objective is to ask them 1249 questions that assess the accuracy and plausibility of their predictions about events. 1250 You will write question-answer pairs: 1251 1. The question should challenge the person to predict an outcome or development related to the article's 1252 content as if they were being asked one week or one month ago. Please provide the question that can be 1253 answered on {}, but only guessable not answerable before {}. 1254 2. The answer MUST be based on factual information from the article. Ensure that the answers do not 1255 predict outcomes that have not been explicitly stated in the article. 1256 [Rules:] 1257 Article: {}. Publishing date: {} 1259 Please generate four questions about the above article, along with answers. You should follow the instructions below: 1261 1. Please turn the key point "{}" into the question, with focusing more on whether the event will happen. 1262 2. The question should NOT be designed for reading comprehension. Please focus more on what 1263 happened rather than the implications after the event. 1264 3. The question MUST be in future tense. - Start the first question with "Will", with the answer as "Yes". 1265 - Start the second question with "Will", with the answer as "No". 1266 - Start the third and fourth questions with a phrase like "What will", "Who will", "Where will", "Which 1267 xxx will", "How much will", or "How many will". 1268 4. There must be a time element in the question. It can be phrases like "In {} ...", "By {}, ...", "... in 1269 {**}**?". 5. You MUST NOT use unclear implicit time element phrases like "in the future" or "in the upcoming 1270 weeks". 6. You should avoid: questions that require numerical reasoning; questions that require substantial world 1272 knowledge. 1273 7. The answer MUST be short and concise, avoiding using redundant words or repeating the information 1274 in the question. 8. The question must be grammatically correct and contain the information required to answer. NO "he, she, they, it, them, etc" allowed. Please clearly write out the entity you are referencing in the question. 1276 9. The question MUST be able to be answered by the article. 10. The question MUST NOT include the information that came out just now. It should be understandable 1278 to people from the past. Avoid using "How will" or "Why will" questions, as they imply that the event 1279 has already occurred. 1280 [Suggested questions and questions to avoid are detailed below:] 1281 1282 - Keypoint: Delhi experienced its highest-ever temperature of 49.9 degrees Celsius on Tuesday, 1283 leading to water rationing due to the oppressive heat wave. 1284 - Suggested Question: Will Delhi break the highest temperature record again by May 2024? 1285 - Avoid This Question: Will extreme heat events continue to pose a threat to India's development in the upcoming years? 1286 - Reason to Avoid: The time constraint "in the upcoming years" is vague and the question can not be 1287 answered based on today's knowledge. Figure 25: Prompt in the *QA Generation* step (part 1), adapted from Zhang et al. (2024). 1291 1293

1294

	- Keypoint: Owners of nearly 84,000 older Nissan vehicles in the United States equipped with recall
	unrepaired Takata air bags, including models such as the 2002-2006 Nissan Sentra, are advised
	NH I SA to immediately stop driving them due to safety concerns.
	- Suggested Question. Will the older Missail vehicles such as the 2002-2000 Missail Sentra exhibit qual issues by May 2024?
	- Avoid This Ouestion: Will owners of the 2002-2006 Nissan Sentra, 2002-2004 Nissan Pathfinder, a
	2002-2003 Infiniti QX4 heed the NHTSA's advice to immediately stop driving their vehicles in late M
	- Reason to Avoid: This question is overly specific. People from the past would not have known
	"NHTSA's advice".
	- Keypoint: Children's sketches of violent scenes, likely made by children aged 5-7 before
	eruption of Mt. Vesuvius in 79 AD, have been uncovered at the archaeological park of Pompeii.
	- Suggested Question: Will children's sketches of violent scenes be discovered at the archaeological part of Demonstration of New 20242
	of Pollipell by May 2024?
	- Avoid this Question. will the newly discovered children's sketches at the archaeological park Pompeii be available for public viewing by May 2024?
	- Reason to Avoid: This question includes future events about newly discovered children's sketches
	Pompeii, which wouldn't be known to a past audience.
	- Keypoint: North Korea has been sending "filth and garbage" across the border to South Korea us
	giant balloons as a new strategy, prompting South Korean authorities to warn of the objects landing
	residential areas. The move, according to North Korean state media KCNA, was to retaliate agai
	South Korean activists who often send materials to the North.
	send materials to the North by May 2024?
	- Avoid This Ouestion: Will North Korea continue using balloons to send items across the border
	South Korea by May 2024?
	- Reason to Avoid: The word "continue" should not be used here. The question MUST NOT include
	information that came out just now.
	[Output] New place suite from place and consider superior size following the insta
	[Output.] Now please while four clear and concise question-answer pairs following the instructions and examples above. Once again the question should NOT be designed for reading comprehension
	but of forecasting interests. Also, vague and implicit time elements like "in the future". "in the upcom
	weeks" or "in the coming years" should NOT be used. The question should be able to answer on {},
	only guessable not answerable before {}. You should output the question along with its answer, in
	format of
	Question 1: "Will XXX?"
	Allswei 1. 1es.
	Ouestion 2: "Will xxx?"
	Answer 2: No.
1	Question 3: Either "What will xxx?", "Who will xxx?", "Where will xxx?", "Which xxx wi
1	"How much will xxx?", or "How many will xxx?"
	Answer 3: xxx.
	Question 4: Fither "What will yyy?" "Who will yyy?" "Whore will yyy?" "Which we wi
	"How much will xxx?", or "How many will xxx?" where will xxx?, which xxx will xxx?"
	Answer 4: xxx.

Question: What will New York officials do to ensure safety for the ICC Men's T20 Cricket World
following global threats from ISIS-K?
Answer: New York officials will implement increased safety precautions for the event.
Reasoning: The answer is straightforward and expected, as it directly restates the premise of the que
without providing any new or specific details on how the safety precautions will be implemented or they might entril
they high entail.
Instructions
Evaluate each question-answer pair by assigning points in each of the categories based on the cri
provided. Please be strict on giving points. If the requirements of a category are not fulfilled, assi-
point of 0.
Please strictly follow this output template:
