

How to be Helpful on Online Support Forums?

Anonymous ACL submission

Abstract

Internet forums such as Reddit offer people a platform to ask for advice when they encounter various issues at work, school or in relationships. Telling helpful comments apart from unhelpful comments to these advice-seeking posts can help people and dialogue agents to become more helpful in offering advice. We propose a dataset that contains both helpful and unhelpful comments in response to such requests. We then relate helpfulness to the closely related construct of empathy. Finally, we analyze the language features that are associated with helpful and unhelpful comments.

1 Introduction

When people encounter issues in their lives (such as problems with family and friends, difficulties at school/work as well as troubles in pursuing one’s interests and hobbies), many seek for advice in order to solve these problems. Some ask for such advice on internet forums, such as the *r/Advice* subreddit¹. Other users can then comment on these posts to attempt to help the post authors.

While many users can actively offer help, not all of them will be seen as helpful by the user asking for advice. Examples of a helpful and an unhelpful comment are presented in Figure 1 to show their contrast. In order to support people and dialogue agents to be more effective in offering helpful comments, a critical first step is to understand what makes these comments helpful. We make use of a feedback system on *r/Advice* that labels comments based on whether the original post author finds comments to be helpful. Based on this feedback system, we introduce a new dataset of comments, labelled with their binary helpfulness.

Helpfulness has been extensively studied based on exchanges in online support communities (Chuang and Yang, 2012; Schotanus-Dijkstra et al.,

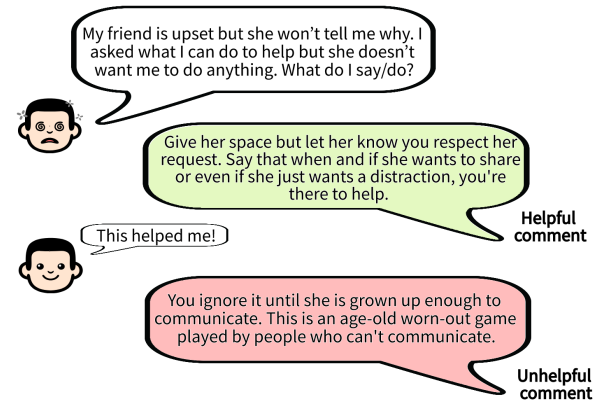

Figure 1: Examples of helpful and un-helpful comments to a help-seeking post. “Helped” is a magic word for labelling the response.

2014; Paulus and Varga, 2015; Subramani and O’Connor, 2018; McKiernan et al., 2018; Green et al., 2020). These studies found that helpfulness is associated with various characteristics such as emotional warmth, relevant knowledge, willingness to understand, empowering choice, active listening as well as sharing of similar experiences. However, these studies are solely based on qualitative interpretations and have thus far not sought to associate language features with helpfulness. To overcome this limitation, we seek to identify words that are most positively and negatively associated with helpfulness, and relate these words to characteristics of helpfulness from prior literature.

Helpfulness is closely related to empathy, as they share many characteristics such as being emotionally warm and compassionate; accepting others’ frame of reference, and practising active listening (Davis, 1983; Baron-Cohen and Wheelwright, 2004; Zhou et al., 2003). We show that people’s average helpfulness across all of their comments correlates with their measured empathy score. We also relate our study to literature on the language features that are associated with empathy (Sharma et al., 2020; Xiao et al., 2015; Gibson et al., 2015)

$\alpha = 0.90$) and test-retest reliability after 12 months ($r = 0.97, p < .001$).

Participants Only users with more than 20 comments were included to minimize the likelihood that their average helpfulness was biased due to limited observations. 508 Reddit users were sent an online questionnaire through Reddit and 91 responded. Gender and age were optional to report. 86 participants reported gender (53 male and 33 female) and 83 reported age ($M=33.7, SD=13.8$). The mean user helpfulness is 0.5440 ($SD=0.1956$). Using a two-sample t-test, the distribution of EQ scores ($M=24.45, SD=8.822, N=91$) in this study is found to be not significantly different ($t(1850) = 0.0169, p = 0.9866$) from the sample ($M=23.8, SD=8.75, N=1761$) in Wakabayashi et al. (2006), demonstrating the representativeness of our sample.

Figure 2: Empathy quotient (EQ) score against User Helpfulness

Results As illustrated in Figure 2, there is a moderate correlation effect between EQ and User helpfulness ($r(91) = 0.359, p < 0.001$). We also explored correlating User helpfulness with various subscales of the EQ, namely cognitive empathy, affective empathy and social skills based on Zhou et al. (2020). Helpfulness correlates most strongly with cognitive empathy ($r(91) = 0.355, p < 0.001$), followed by affective empathy ($r(91) = 0.261, p = 0.012$) and finally social skills ($r(91) = 0.203, p = 0.054$). This suggests that helpful commenters more often are better able to understand how the post authors think compared to how they feel or communicating it across in a social deft manner (which has a boundary p value).

5 Predicting for Helpful Comments

To explore the potential for the dataset to be useful in training models to distinguish between help-

	Micro-F1 (σ)
BERT	69.2 (0.60)
Logistic Regression	65.4 (0.55)
Naive Bayes	63.0 (0.44)
Support Vector Classifier	63.5 (0.59)
Random Forest	65.1 (0.60)

Table 1: Performance of baseline models on test set. Details of their preparation are in Appendix B

ful and unhelpful comments, we trained several baseline models and report their micro-average F1 scores. The performance of baseline models on this task is relatively low but similar to the performance on empathy datasets (Gibson et al., 2015; Khanpour et al., 2017; Sharma et al., 2020). The relatively low performance of baseline models on this task suggests that while recognizing helpfulness in language is trivial for typically-developing humans, they remain challenging for machines. Techniques such as commonsense reasoning (Sap et al., 2019; Bosselut et al., 2019) can be explored in the future to better capture the highly complex relationship between language and helpfulness.

Significant Predictors of Helpfulness To characterize helpfulness in our dataset, significant predictors of helpfulness ($p < 0.05$) based on the Logistic Regression model were extracted and analysed.⁴ Thematic categories that were inductively generated from these predictors are shown in Table 4 while word clouds are available in Appendix D.

The first overarching theme is positive and friendly words. Helpfulness is positively predicted by polite, friendly-sounding and optimistic-sounding words but negatively predicted by words that indicate negative emotions. This relates to the literature findings on how uplifting and friendly online support peers are found to be more helpful. (Paulson et al., 1999; Subramani and O’Connor, 2018) Affect-related words (such as sad and tears) were previously found to be significant predictors of empathy (Gibson et al., 2015).

A second overarching theme is words relating to attempts to understand the perspective of others. Helpful commenters do so by addressing post authors directly, instead of patronizing the difficulties that they face. This is also in agreement with

⁴The dataset used to extract the most significant predictors is slightly different. Only one comment was sampled from each post and author to overcome the problem that the covariance matrix was originally non-invertible.

Direction	Themes	Words	Examples
Positive predictors	Polite, friendly sounding words	personally, friend, glad, welcome, feels, hey	Me, personally ...I'd let it slide. He'd be That's okay I'm just glad that you were able to maybe text her? Be like hey , just wanted to say
	Optimistic sounding words	good, luck hope, hopefully yes, learned, helped forward, strong,	session with your therapist. Good luck hope something I say can help you a little! And yes that is dangerous and quite work that you can look forward to.
	Words addressing the post author directly	you	I really think you deserve better. You sound like I understand that you really like these guys as long as you feel you are making the best of
Negative predictors	Words indicating negative emotions	victim, kill, rid bad, depression	to be labelled as a victim . She might be afraid of I was internalizing every bad thing that happened
	Words that patronize the problem faced by the post author	dealt, wish easy, promise advice, told	it's the latter, as I dealt with when I was like it seems like the easy solution to your situation. The best advice I can give you though

Table 2: Thematic categories for significantly predictors of Helpfulness. Statistical analysis in Appendix E

literature on how helpfulness is associated with peers' attempt to accept others' frame of references and experiences. (Subramani and O'Connor, 2018; Green et al., 2020) Furthermore, terms indicating an inclination to find out more about the perspective of others (e.g. "do you think", "it sounds like" and "you think about") were also predictors in empathy datasets (Gibson et al., 2015; Xiao et al., 2015). Overall, the overarching themes that are predictive of helpfulness in our dataset are supported by literature on helpfulness and language features associated with empathy.

6 Human-Annotated Features for Comment Helpfulness

To better understand the capabilities and limitations of language features in capturing comment helpfulness, two graduate students manually annotated a selection of helpful comments. Annotations were done on 5 comments each from 91 authors who responded to our empathy quotient questionnaire. Comments were sampled using a stratified approach that results in a sampled average helpfulness to be closest possible to the author's average helpfulness score ($Pearson's\ r = 0.937, p < 0.001$). Then we labelled each comment with one or more of the 10 possible labels based on helpfulness literature (see Section 2). They are 1. Highly directive, short advice 2. Dismissing concern 3. Negative terms 4. Tangential or unspecific comment 5. Share similar experience 6. Ask clarifying questions 7.

Relevant knowledge 8. Emotional support 9. Recognizing difficulty 10. Tentative language. Average Cohen's κ is 0.690 ($\sigma=0.107$). Definitions and Cohen's κ for each label are in Appendix 5.

Using a logistic regression, we found that only the use of negative terms and tangential or unspecific comment are negatively associated with helpfulness ($p < 0.05$) while providing relevant knowledge is positively associated ($p < 0.05$). The use of negative terms was also captured by the logistic regression based on language use while the other two factors were not. An inspection of examples revealed that negative terms only comprises of a small set of words while those two factors require contextual semantic understanding of what is relevant knowledge to a situation and what is tangential. Future work can make use of knowledge-enhanced models (Peters et al., 2019; Clark et al., 2021) to better capture such contextual understanding.

7 Conclusion

We introduce and plan to openly release a novel dataset containing helpful and unhelpful comments in response to posts seeking for advice on life issues. We show that the helpfulness of such comments is related to the commenters' empathy and pioneer an analysis into language features predictive of helpful and unhelpful comments on online support communities. Our work can contribute towards supporting people and automated dialogue agents to offer more helpful comments to others.

Ethics and Broader Impact

This project has been approved by an Institutional Review Board. The use of Reddit data in this project is in alignment with the Reddit End User License Agreement and the Terms of Use for Developers. Because part of the project requires participants to respond to questionnaires, we made sure that the items were phrased sensitively so that no unintended harm would be caused. No payment was made to voluntary participants, as the survey could be done within a few minutes. We also guided participants to make informed decisions about their participation, giving them the opportunity to withdraw any time, during and after the completion of the questionnaire. The collected information, which does not include personally identifiable information, was stored securely with access restricted to the research team. We also manually inspected a small selection of Reddit data to ensure that they do not contain names, personally identifying information or offensive content. We anticipate that this project can accelerate the development of models that can better detect and express helpfulness in social settings, between humans and with social dialogue agents.

A Empathy Quotient Questionnaire

Items originate from the long form of Empathy Quotient questionnaire (Baron-Cohen and Wheelwright, 2004), which is well-cited (>3500 citations) and demonstrates good validity in large (>500,000) and culturally-diverse samples (Kosonogov, 2014; Groen et al., 2015; Greenberg et al., 2018). The short form was chosen to reduce the time taken to answer the questionnaire and thereby increase the response rate. The short form is a 22-item forced-choice self-report questionnaire that can be answered on a four-point Likert Scale (Strongly Agree, Agree, Disagree, Strongly Disagree). Questions include “I often find it difficult to judge if something is rude or polite”, “I can pick up quickly if someone says one thing but means another”, and “I am good at predicting how someone will feel”. Each response can give 0, 1 or 2 points, leading to a maximum total EQ score of 44.

B Baseline Models

Each model was run with 5 different random seeds.

BERT Pre-trained BERT English-base-uncased WordPiece tokenizer was used. We fine-tuned a BERT Sequence Prediction model (English-base-uncased version with 12-layer, 768-hidden, 12-heads, 110M parameters accessed from <https://github.com/huggingface/transformers>). BertAdam optimizer was used with 0.1 epoch for warmup and learning rate of $2 * 10^{-6}$ following a search within $\{1, 2, 5\} * 10^n$, $-6 \geq n \geq -4$ using F1 as criterion. Maximum sequence length was 512 tokens, batch-size was 8 and epoch number was 2. Training took 4 hours on a Nvidia P100 GPU.

Others Text was split up into individual words and lower-cased. The number of times each word occurred in each text was then counted. Words that occurred fewer than ten times altogether were removed to minimize the effects of misspelled or rare words. Logistic Regression, Linear Support Vector Classifier, Multinomial Naive Bayes and Random Forest models were trained (accessed from <https://scikit-learn.org/stable/>) All hyper-parameters were default except adjusting the number of estimators in the Random Forest model to 100. Training took negligible time (< 0.5 hours) on CPU.

C Performance of Baseline Models (Validation Set)

	Micro-F1 (σ)
BERT	69.5 (0.52)
Logistic Regression	65.1 (0.12)
Naive Bayes	62.9 (0.40)
Support Vector Classifier	63.5 (0.34)
Random Forest	65.2 (0.33)

E Statistical Description for Each Theme

F Labels and Descriptions for Manual Annotation of Helpfulness

G Empathy Questionnaire Instructions

Direction	Themes	Words	Mean Info. Gain	Proportion (%)		
				Total	Helpful	Unhelpful
Positive predictors	Polite, friendly sounding words	personally, friend, glad, welcome, feels, hey	0.002759	11.7	16.1	8.14
	Optimistic sounding words	good, luck hope, hopefully yes, learned, helped forward, strong,	0.00431	27.6	37.0	20.0
	Words addressing the post author directly	you	0.0484	73.2	84.4	64.2
Negative predictors	Words indicating negative emotions	victim, kill, rid bad, depression	0.000712	7.81	9.67	6.32
	Words that patronize the problem faced by the post author	dealt, wish easy, promise advice, told	0.000864	12.2	15.3	9.67

Table 4: Statistical Description for themes identified from significantly predictors of Helpfulness. Helpful comments contain more words from both positive and negative predictors, but the gap between helpful and unhelpful comments is greater for positive predictors.

Label	Description	Cohen’s κ
Highly directive, short advice	Extremely short advice that are directing what the post author should do (commonly yes, no, go do this! etc)	0.724
Dismissing concern	Saying that what the post author is going through is not a big deal	0.662
Negative terms	Mentioning negative terms that the author did not bring up (crazy, psycho etc).	0.788
Tangential or unspecific comment	Mentioning random terms that has nothing to do with the author’s post.	0.794
Share similar experience	Bringing up that the comment author experienced something similar as the post author	0.677
Ask clarifying questions	Asking questions to clarify what the author’s situation really is. Alternatively, they can be saying “If it’s situation A then . . . , otherwise if situation B then . . .”	0.644
Relevant knowledge	Bringing any knowledge to help solve the post author’s specific situation (for instance, something like “you can try . . . “ or “there is this resource . . .”)	0.802
Emotional support	Offering emotional comfort to the post author (something like I am sure this will get better or It’s definitely not your fault)	0.650
Recognizing difficulty	Acknowledging that it’s a very bad situation for the author to be in (I’m sorry that this is a really bad situation)	0.419*
Tentative language	Phrasing advice as tentative suggestions – such as using “you might want to try . . .” or “I am no expert on this but . . .”	0.739

Table 5: Labels, descriptions and Cohen’s κ for manual annotation of helpfulness in comments. * Cohen’s κ for “Recognizing difficulty” is low due to the very low number of positive labels (<5%)

08/03/2020 Empathy Questionnaire

Empathy Questionnaire

This questionnaire comprises of your Reddit username and 22 items, which take around 2 mins.

Give the first answer that comes to your mind for accuracy! Your gender and age are optional.

08/03/2020 Empathy Questionnaire

I am quick to spot when someone in a group is feeling awkward or uncomfortable.

I can't always see why someone should have felt offended by a remark.

I don't tend to find social situations confusing.

Other people tell me I am good at understanding how they are feeling and what they are thinking.

I can easily tell if someone else is interested or bored with what I am saying.

Friends usually talk to me about their problems as they say that I am very understanding.

I can sense if I am intruding, even if the other person doesn't tell me.

Other people often say that I am insensitive, though I don't always see why.

I can tune into how someone
