Paper under double-blind review

Figure 1: GUI-WORLD: A comprehensive dataset for GUI-oriented capabilities encompasses six scenarios and diverse tasks, offering significant potential for real-world applications. All screenshots presented are sampled from our dataset.

### **ABSTRACT**

Recently, Multimodal Large Language Models (MLLMs) have been used as agents to control keyboard and mouse inputs by directly perceiving the Graphical User Interface (GUI) and generating corresponding commands. However, current agents primarily demonstrate strong understanding capabilities in static environments and are mainly applied to relatively simple domains, such as Web or mobile interfaces. We argue that a robust GUI agent should be capable of perceiving temporal information on the GUI, including dynamic Web content and multistep tasks. Additionally, it should possess a comprehensive understanding of various GUI scenarios, including desktop software and multi-window interactions. To this end, this paper introduces a new dataset, termed GUI-WORLD, which features meticulously crafted Human-MLLM annotations, extensively covering six GUI scenarios and eight types of GUI-oriented questions in three formats. We evaluate the capabilities of current state-of-the-art MLLMs, including Image LLMs and Video LLMs, in understanding various types of GUI content, especially dynamic and sequential content. Our findings reveal that vision LLMs struggle with dynamic GUI content without manually annotated keyframes or operation history. On the other hand, video LLMs fall short in all GUI-oriented tasks given the sparse GUI video dataset. Therefore, we take the initial step of leveraging a fine-tuned video LLM as a GUI agent based on GUI-WORLD, demonstrating an improved understanding of various GUI tasks. However, due to the limitations in the performance of base LLMs, we conclude that using video LLMs as GUI agents remains a significant challenge. We believe our work provides valuable insights for future research in dynamic GUI content understanding.

### 1 Introduction

Multimodal Large Language Models (MLLMs), such as GPT-4V(ision) (OpenAI, 2023) and LLaVA (Liu et al., 2023b), have significantly contributed to the development of both vision and

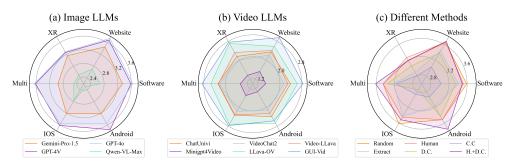

Figure 2: Comparative performance of different MLLMs in six scenarios of GUI-WORLD. (a) Performance of four mainstream Image LLMs. (b) Performance of three video LLMs and our **GUI-Vid**. (c) Performance among six methods. See subsection 3.2 for more details.

language domains (Yin et al., 2024). These models bring forth innovative solutions and paradigms for traditional visual tasks, including visual reasoning (Yang et al., 2023b), medical image interpretation (Li et al., 2024b), and applications in embodied agents (Huang et al., 2023). One particularly promising area is Graphical User Interface (GUI) understanding, which holds significant potential for real-world applications, such as webpage comprehension (Hong et al., 2024; Lai et al., 2024) and navigation by GUI agents (Yang et al., 2023a; Niu et al., 2024; Wang et al., 2024). The key challenges of GUI understanding are twofold: effective GUI agents are expected to (1) possess a deep understanding of GUI elements, including webpage icons, text identified through Optical Character Recognition (OCR), and page layouts, and (2) exhibit an exceptional ability to follow instructions within GUI contexts, such as conducting searches through search engines.

Despite significant progress, as illustrated in Table 1, prior studies on GUI-related datasets and benchmarks suffer from the following limitations: (1) *Inability to Handle Dynamic Environments*. Most studies predominantly focus on the static features of GUI scenarios, neglecting the need for MLLMs to effectively process sequential information and dynamic operations. For instance, an agent's task performance can be disrupted by unexpected elements such as pop-up advertisements, underscoring a gap in handling dynamic sequential tasks. (2) *Limited Scenarios*. Current research is typically restricted to Web-based environments, which limits the models' generalization and robustness. For instance, GUI agents may need to operate across diverse platforms such as Windows, macOS, Linux, iOS, Android, and XR environments. Additionally, operations may sometimes involve multiple windows. Therefore, expanding the scope of research to encompass these varied environments will enhance the adaptability and effectiveness of GUI agents.

To mitigate these gaps, this paper introduces GUI-WORLD, a comprehensive dataset containing 12,379 GUI videos, specifically designed to evaluate and enhance the capabilities of GUI agents. This dataset encompasses a wide range of GUI scenarios, including popular websites, desktop and mobile applications across various operating systems, multi-window interactions, as well as XR environments. The data collection process involves sourcing GUI videos from screen recordings and instructional videos on YouTube. Subsequently, we utilize a Human-MLLM collaborative approach to generate a diverse set of captions, complex queries, and multi-round conversation and finally construct GUI-WORLD.

Likewise, we also establish a comprehensive benchmark for GUI understanding, which encompasses nine mainstream MLLMs, five keyframe selection strategies, and six GUI scenarios, aiming to provide a thorough evaluation of the MLLMs' GUI-oriented capabilities. As shown in Figure 2, the assessment results indicate that most MLLMs struggle with GUI-WORLD, highlighting their limited dynamic understanding of graphical interfaces and underscoring the need for further enhancement.

Leveraging this dataset, we take the first step to fine-tune a video GUI agent adept at handling dynamic and sequential GUI tasks, leading to substantial enhancements in the general capabilities of GUI agents and showcasing the utility and effectiveness of GUI-WORLD. Additionally, we delve into discussing various factors critical to GUI understanding, including the integration of textual information, the number of keyframes, image resolutions, and vision perception for a pioneer comprehensive study in the GUI domain.

Overall, the key contributions of this paper are three-fold:

Table 1: Comparison of GUI datasets and benchmarks. 'Sem.': semantic instruction level, 'VL': Vision-Language, 'Seq.': Tasks for sequential images, 'Cro.': Cross-app or multi-window tasks, 'Dyn.': Tasks for dynamic GUI content.

Dataset	Size	Sem.	VL	Video	Web	Env . Mob	Type . Desk.	XR	Task Seq.	Cov Cro.	erage Dyn.	Task

- A New Dataset. We propose GUI-WORLD, a comprehensive GUI dataset comprising 12,379 videos specifically designed to assess and improve GUI-oriented capabilities of MLLMs, spanning a range of categories and scenarios, including desktop, mobile, and eXtended Reality (XR), and representing the first GUI-oriented instruction-tuning dataset in video domain.
- Comprehensive Experiments and Valuable Insights. Our experiments indicate that most existing
  MLLMs continue to face challenges with GUI-oriented tasks, particularly in sequential and dynamic
  GUI content. Empirical findings suggest that improvements in vision perception, along with an
  increase in the number of keyframes and higher resolution, can boost performance in GUI tasks.
- A Explorative GUI Agent. Based on GUI-WORLD, we propose GUI-Vid, a GUI-oriented video LLM with enhanced capabilities to handle various and complex GUI tasks. GUI-Vid shows a significant improvement on the benchmark and achieves results comparable to the top-performing models, thereby paving ways for the future of GUI agents.

### 2 GUI-World: A Dataset for GUI Understanding

### 2.1 OVERVIEW

We introduce GUI-WORLD, a comprehensive dataset covering six GUI scenarios including video, human-annotated keyframes, as well as detailed captions and diverse types of QA produced by our data curation framework, aiming at benchmarking and enhancing the general GUI-oriented capabilities. These GUI scenarios encompass desktop operating systems (*e.g.*, macOS, Windows) and mobile platforms (*e.g.*, Android and iOS), websites, software, and even extended-range technologies (XR) (*e.g.*, GUI in Apple Vision Pro (Apple, 2024)). We divide the dataset into a train-test split, each containing 10,702 and 1,677 samples. Discussion for each scenario is in subsection A.1.

As illustrated in Figure 3, the development of GUI-WORLD is structured around a two-stage process. Details regarding video and query statistics are provided in Table 2, which includes distributions of

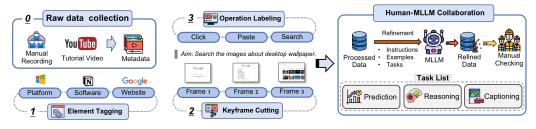

Figure 3: An overview construction pipeline of GUI-WORLD.

Table 2: The statistics of GUI-WORLD. For Android, we select videos from Rico (Deka et al., 2017) and randomly sample 10 frames. *Avg. Frame* refers to the average number of frames in each clip, and *Avg. Anno*. refers to the average number of manually annotated GUI actions.

Category	Total Videos	Free-form	MCQA	Conversation	Total Frame. (Avg.)	Avg. Anno.
Software	4,720	27,840	9,440	9,440	23,520 (4.983)	7.558
Website	2,499	14,994	4,998	4,998	15,371 (6.151)	6.862
IOS	492	2,952	984	984	2,194 (4.459)	7.067
Multi	475	2,850	950	950	2,507 (5.277)	7.197
XR	393	2,358	786	786	1,584 (4.030)	10.970
Android	3,800	15,199	7,600	7,600	38,000 (10.000)	-
Summary	12,379	76,673	24,758	24,758	83,176 (6.719)	7.463

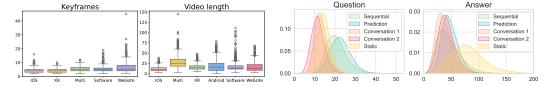

Figure 4: **Left:** Distribution of the number of keyframes and video lengths. **Right:** Length distribution for each type of question and its golden answer.

the number of keyframes, video lengths, and the lengths of queries and their corresponding golden answers shown in Figure 4 and Figure 5 for case study.

### 2.2 GUI VIDEO COLLECTION AND KEYFRAME ANNOTATION PROCESS

We describe the pipeline for collecting screen recordings from student workers and GUI-related instructional videos from YouTube for GUI-WORLD and the procedures followed to convert these videos into keyframe sequences.

A significant portion of our video data is derived from screen recordings executed by student workers, which can directly reflect real-life GUI usage scenarios. A typical video collection scenario involves assigning a student worker a specific software task. The student begins by familiarizing themselves with the software, followed by recording a series of operations in a short video clip, such as "Sign up", "Sign in", "Create a New Page", and "Invite Other Collaborators" in the software "Notion<sup>1</sup>".

Despite the high fidelity of these manually recorded videos, we encounter several challenges: (1) Student workers often require substantial time to acquaint themselves with professional software (e.g., MATLAB, Adobe After Effects (Ae)), which can hinder the progress of data collection. (2) The videos may lack comprehensiveness, typically capturing only commonly used operations and overlooking rarer functions crucial for dataset completeness. To address these issues, we also source videos from social media platforms that host a diverse array of GUI videos. Specifically, we download tutorial videos from YouTube—given its prevalence as a video-sharing platform—because they richly detail various GUI operations. These videos are then segmented into shorter clips, each representing a distinct sequence of operations.

The subsequent step involves annotating these video clips with keyframes and textual descriptions of each keyframe using custom-designed annotation software. Although several algorithms exist for keyframe extraction (Zhu et al., 2016; Yan et al., 2018; Mahasseni et al., 2017; OpenCV), they typically underperform with GUI videos where changes between frames might be minimal (e.g., a slight movement in the mouse cursor). To ensure high-quality datasets, we therefore perform manual extraction of these keyframes. Each keyframe is meticulously annotated to include details such as the operation performed, the purpose between two keyframes, the software or website used, mouse actions (e.g., scroll, click), and keyboard inputs (e.g., copy (Ctrl + C), paste (Ctrl + V), specific input). We detail our annotation process in subsection A.3.

<sup>1</sup>https://www.notion.so/

#### 2.3 GUI TASKS GENERATION FROM HUMAN-MLLM COLLABORATION

Drawing insights from prior research (Dekoninck et al., 2024), we develop a Human-MLLM collaboration pipeline to annotate captions and diverse types of QA specifically tailored for GUI comprehension. The process involves inputting an instructional prompt, a comprehensive description, key information (e.g., system or application), and a sequence of human-annotated keyframes into GPT-4V. As depicted in Table 12, GUI-WORLD features various question types, detailed as follows:

- ▶ Detailed and Summarized Captioning: This task challenges basic GUI knowledge and multimodal perception, also addressing the deficiency of detailed GUI content in video-caption pairs. Initially, GPT-4V generates two distinct descriptions for each video: one concentrating on fine-grained details and the other on overall information. Furthermore, GPT-4V provides a succinct summary, highlighting core operations and overarching objectives in the video.
- ▶ Static GUI Content: This task challenges MLLM with textual, layout, and iconographic analysis of static GUI content. We instruct GPT-4V to generate free-form queries with a golden answer concerning static GUI elements or specific scenes that recur in more than two keyframes, ensuring their consistent presence in the video. Additionally, GPT-4V also crafts QA pairs that evaluate inferential skills in static content, focusing on interrelations among icons or textual information.
- Dynamic and Sequential GUI Content: This task concentrates on temporal content in GUI video, such as dynamically changing interfaces, and aims to elucidate the sequential information and reasoning chains within GUI content. We direct GPT-4V to identify consistently changing elements to create queries for dynamic content. Moreover, predictive tasks are formulated on order and temporal relation in provided sequential images, challenging agents to anticipate future events or states.

Table 3: The overall performance in six GUI scenarios for MCQA and Free-form queries. 'MC' means Multiple-Choice QA and 'Free' represents the average score of all free-form and conversational queries.

	Models	Softv	vare	Web	site	X	R	Mu	ılti	IO	S	And	roid	Av	g.

ige	Video-LLaVA	52.9%	2.290	52.4%	2.410	44.2%	2.258	45.9%	2.329	49.7%	2.319	51.3%	2.259	49.4%	2.311
>	GUI-Vid	59.9%	2.847	54.1%	2.957	55.6%	2.764	52.9%	2.861	51.8%	2.773	53.4%	2.572	54.6%	2.796

In the last stage, human annotators will follow the guideline in subsection A.3 and carefully review the entire video and MLLM-generated QA pairs to correct inaccuracies and hallucinations, as well as supplement information for both questions and answers to make these tasks more challenging.

### 3 EXPERIMENTS AND ANALYSIS

### 3.1 EXPERIMENTAL SETUPS

Models.<sup>2</sup> We conduct evaluations on four of the most popular vision LLMs: GPT-4V(ision) (OpenAI, 2023), GPT-4o (OpenAI, 2024), Qwen-VL-Max (Bai et al., 2023), LLaVA-OV-7B (Li et al., 2024a), and Gemini-Pro-1.5 (Team et al., 2023). Additionally, we test the effect of different vision inputs on GPT-4o, using no input, low and high-resolution settings, as well as without providing images, to further assess how resolution influences performance. Each model's responses employ a three-step Chain-of-Thought (CoT) (Wei et al., 2022) process, i.e., 'Describe-Analyze-Answer', to evaluate their peak performance. Additionally, we assessed four advanced video LLMs—ChatUnivi (Jin et al., 2023), Minigpt4-video (Ataallah et al., 2024), Videochat2 (Li et al., 2023c), VideoLLaVA (Lin et al., 2023a) —for their performance on GUI content. Detailed experimental setups are referred to Appendix C.

**Evaluation Metrics.** To assess free-form questions and multiple-round conversations, we utilize the LLM-as-a-Judge methodology, which assigns a similarity score ranging from 1 to 5 between MLLM's response and a predefined golden answer, already validated by previous studies (Zheng et al., 2023; Liu et al., 2023d; Chen et al., 2024a). For multiple-choice questions, we measure performance using accuracy as the primary evaluation metric.

**Keyframe Extraction.** We benchmark on three keyframe selection settings: (1) *Linspave*, where frames are evenly sampled at fixed time intervals within a video; (2) *Program*, with programmatic method Katna (KeplerLab, 2023); (3) *Model-based*, where leverage pre-trained vision representation from VIP (Ma et al., 2022) and R3M (Nair et al., 2022) to form UVD (Zhang et al., 2024d); and (4) *Human*, where humans select keyframes during the annotation process. We use *Human* setting for ImageLLMs in our main experiment with an average of 6.719 frames (Table 2). For all other settings, we input 10 frames into each MLLM.

**Additional Information Integration.** To investigate the effectiveness of integrating image-caption models for LLMs—typically employed in natural videos—and the helpfulness of textual GUI content in accomplishing GUI-oriented tasks, we implement three experimental settings: Detailed Caption, Concise Caption, and Vision + Detailed Caption. GPT-4V is utilized to provide captions of these keyframes, integrating human annotators' operational intents to more accurately describe each frame, being validated in subsection A.3.

<sup>&</sup>lt;sup>2</sup>Given that GPT-4V was announced to be deprecated, we used GPT-4o to conduct some ablation studies instead of GPT-4V, aiming to ensure our results provide longer-term reference value.

Table 4: Overall performance in six GUI scenarios for MCQA and Free-form queries. 'D.C.' means detailed caption, and 'C.C.' means concise caption, and \* means no vision input.

### 3.2 EMPIRICAL RESULTS

Commercial Vision LLMs outperform Open-source Video LLMs in Zero-shot Settings. Commercial vision LLMs, notably GPT-4V and GPT-4o, consistently outperform open-source video LLMs in zero-shot settings. As detailed in Table 3, GPT-4o exhibits superior performance across all GUI scenarios in complex tasks, reflected in its high scores in both multiple-choice and free-form queries, with an average of 84.8% and 3.573. Similarly, Gemini demonstrates strong capabilities in captioning and descriptive tasks within software and iOS environments, scoring 2.836 and 2.936, respectively, as shown in Table 22. Further analysis (Figure 6) reveals that GPT-4V excels in applications with minimal textual content and simple layouts, such as TikTok, health apps, and GitHub. In contrast, its performance drops in more intricate applications like Microsoft ToDo and XR software. As for video LLMs, their significantly poorer performance is attributed to two main factors: their inability to accurately interpret GUI content from user inputs and a lack of sufficient GUI-oriented pre-training, which is evident from their inadequate performance in basic captioning and description tasks. See Appendix D for other metrics and detailed fine-grained performance.

**Dynamic GUI Tasks Continue to Challenge MLLMs.** In the fine-grained tasks depicted in Table 5, GPT-4V and GPT-40 excel with dynamic GUI content and conversational tasks but struggle with providing detailed descriptions for entire videos and static content. This discrepancy is attributed to minor variations in GUI that significantly impact its semantic meaning. Enhancing the number of keyframes and the granularity of perception might mitigate these issues. Among video LLMs, ChatUnivi excels in conversational tasks by effectively leveraging contextual nuances, particularly in subsequent rounds, yet it underperforms in caption tasks. In contrast, GUI-Vid demonstrates proficiency in dynamic tasks but falls short in both captioning and static content. This gap is linked to

Table 6: Performance comparison of keyframe selection methods for GPT-40: *Model-based* keyframe identifiers from embodied AI demonstrate comparable performance to *human-selected* keyframes.

Settings	1	otion		ex Tasks	Conve	Average	
	Concise	Detailed	Static	Dyn.	Round 1	Round 2	
Human	3.911	3.031	3.131	3.318	3.981	4.132	3.573
Program	3.643	2.764	2.872	3.052	3.702	3.837	3.300
Linspace	3.749	2.941	3.000	3.077	3.687	3.843	3.440
UVD+vip	3.954	3.105	3.321	3.219	3.944	4.107	3.581
UVD+r3m	3.972	3.121	3.352	3.243	3.975	4.119	3.612

Table 7: The improved performance with higher resolution inputs demonstrates the critical role of vision input in GUI-related tasks.

Cattina	Cap	otion	Comple	ex Tasks	Conve	A	
Setting	Concise	Detailed	Static	Dyn.	Round 1	Round 2	Average
w/o Vision	2.187	1.872	2.486	2.979	3.760	4.059	2.891
Low Resolution	3.672	2.794	2.869	3.150	3.783	4.041	3.394
High Resolution	3.911	3.031	3.131	3.318	3.981	4.132	3.574

deficiencies in backbone pretraining, which lacked comprehensive GUI content crucial for effective vision-text alignment, as evidenced by its poor performance in simple caption task shown in Table 22 and an instruction tuning process failed to fully address these shortcomings.

Vision Perception is Important to Dynamic GUI content. As demonstrated in Table 7, integrating detailed textual information slightly outperforms purely vision-based inputs or detailed captions, akin to a Chain of Thought (CoT) (Wei et al., 2022) setting. Surprisingly, GPT-4V excels in caption tasks with just detailed captions, providing insights on enhancing specific GUI-oriented tasks through additional textual information. However, it still falls short in more challenging tasks, such as retrieving static or dynamic content. This underscores the critical role of visual perception in GUI environments, where even minor changes can significantly impact outcomes.

**Keyframe Selection is Important for GUI-oriented Tasks.** Our experiments demonstrate that *model-based* keyframe identifiers, originally developed for embodied AI applications, perform competitively with *human-selected* across both basic tasks (*e.g.*, caption) and complex tasks (static and dynamic analysis). As shown in Table 6, GPT-40 exhibits significant performance improvements when utilizing these robotics-inspired model-based keyframe identifiers, with the UVD+VIP approach achieving optimal results. These findings suggest the potential to replace manual keyframe selection with automated approaches. Further analysis reveals that embodied AI keyframe identifiers successfully capture semantic transitions in GUI content, while *linspace* and *program*-based selection methods fail to do so, highlighting their particular suitability for GUI-oriented tasks. The substantial performance gaps observed between different selection methods underscore the critical importance of keyframe selection in this domain.

### 4 EXPLORING AND IMPROVING VIDEOLLMS GUI AGENT

### 4.1 Method: Progressive Enhancement

We introduce our strategy to enhance the GUI-oriented capabilities of current MLLMs on both static and dynamic GUI content. Inspired by previous studies (Lai et al., 2024; Li et al., 2023b), we structure our methodology into two distinct fine-tuning stages, as illustrated in Figure 7. Initially, we fine-tune the MLLM on simpler tasks, such as description queries and captioning exercises, to instill a basic understanding of GUI elements. Subsequently, building on this foundation, the second stage aims to augment the MLLM's proficiency with more complex and challenging tasks. Our fine-tuning is all based on the Supervised Fine-Tuning (SFT):  $\mathcal{L}_{SFT}$  ( $\pi_{\theta}$ ) =  $-\mathbb{E}_{(x,y)\sim\mathcal{D}}$  [log  $\pi_{\theta}(y\mid x)$ ], where x is the input, y is LLMs' output, and  $\pi_{\theta}$  denotes the model parameters that need to be optimized.

**Stage-1: Learning Preliminary for GUI Content.** The initial phase focuses on aligning GUI content with a pre-trained vision encoder and a base LLM, utilizing GUI videos accompanied by detailed descriptions and captions. This phase aims to embed a robust understanding of fundamental GUI concepts and terminology within the MLLM. By engaging the model in basically captioning various GUI components, the model learns to recognize and articulate the functionalities and visual characteristics of these elements, thereby laying a solid groundwork for GUI knowledge.

Figure 7: An overview of our fine-tuning architecture, focusing on 1) GUI content alignment and 2) GUI-oriented tasks instruction tuning.

Table 8: The overall results for ablation study on GUI-Vid finetuning. F.K. and E.K. mean keyframes during the finetuning and evaluation process respectively. **I.**: Image, **V.**: Video.

Baseline	FK	ΕK	Da	ata	Softv	vare	Web	site	X	R	Mu	ılti	IO	S	Andı	roid	Av

GOI-VIU	0	16	×	7	59.0% <b>59.9%</b>	2.709 2.847	<b>55.1%</b> 54.1%	2.821 <b>2.957</b>	<b>62.8%</b> 55.6%	2.645 <b>2.764</b>	53.3% 52.9%	2.624 <b>2.861</b>	<b>55.5%</b> 51.8%	2.727 <b>2.772</b>	<b>55.7%</b> 53.4%	2.501 <b>2.572</b>	56.0% 54.8% <b>56.9%</b> 54.6%	2.671 <b>2.796</b>

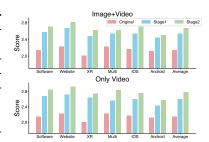

**Stage-2: Mastering Advanced GUI Capability.** Building on the foundational knowledge established in Stage 1, the second stage focuses on advancing the MLLM's proficiency in interacting with GUI elements through more complex tasks. These tasks are designed to simulate real-world scenarios that the MLLM might encounter in GUI environments, which include predicting based on image sequences, engaging in conversations, retrieving both static and dynamic GUI elements, and performing reasoning tasks.

As illustrated in Figure 7, We employ the two-stage training architecture utilizing VideoChat2 (Li et al., 2023b) as our foundational model. Initially, videos and images are encoded using the UMT-L visual encoder (Li et al., 2023d). Subsequently, a QFormer compresses visual tokens into a smaller set of query tokens. Drawing inspiration from (Dai et al., 2023), we enhance the QFormer (Zhang et al., 2024c) by integrating instructions to enable it to extract visual representations pertinent to the given instructions. Additionally, we apply low-rank adaptation (LoRA (Hu et al., 2021)) to base LLM. This model is concurrently fine-tuned with the visual encoder and QFormer using a Vision-grounded Text Generation (VTG) loss:  $\mathcal{L}_{\text{VTG}}(\theta) = -\mathbb{E}\left[\log p(y|v;\theta)\right]$ , where v represents the visual tokens derived from the QFormer, and y represents the text output grounded in the visual context.

### 4.2 EXPERIMENT

**Experiment Setups.** We use two dataset settings to fine-tune GUI-Vid, one with video only, and the other with video and image, detailed in Appendix C. We also vary the number of keyframes (8, 16) fed into GUI-Vid. All our experiments were conducted on a server equipped with dual A800 and dual 4090 GPUs.

Supreme Enhancement of GUI-Vid on Graphic-based Interface After Fine-tuning on GUI-WORLD. As a pioneering study in training video LLMs as screen agents, GUI-Vid significantly outperforms the baseline model, showing an average improvement of 30% across various tasks and GUI scenarios, even surpassing the commercial vision LLM, Qwen-VL-Max. This enhancement is particularly notable in captioning and dynamic task that reason over image sequences, where GUI-Vid matches the performance of GPT-4V and Gemini-Pro. As depicted in Table 8, our two ablation studies during the fine-tuning phase demonstrate that utilizing GUI image-text captioning data significantly enhances the model's preliminary

fine-tuning phase demonstrate that utilizing GUI image-text captioning data significantly enhances the model's preliminary training enhance GUI ability. understanding of GUI elements, outperforming training that relies solely on videos. Additionally, an increased number of keyframes correlates with improved performance across various scenarios, notably in environments featuring multiple windows and software applications. As shown in Figure 8, our two-stage progressive fintuning significantly enhances the performance in all GUI scenarios.

Correlation between GUI understanding and other mainstream GUI tasks. In our explorative experiments, GUI-Vid still fails in GUI operating tasks via code generation like GPT-40 performing in Cradle (Tan et al., 2024), which is due to the baseline LLM's weak performance and the challenges of code generation instruction fine-tuning. To further demonstrate how GUI understanding capability enhances mainstream GUIrelated tasks, including generating operational code (Cheng et al., 2024) and providing chat assistance (Hong et al., 2024), we conduct analysis as follows (detailed in Appendix D):

Table 9: GUI-vid wins more user selection in GUI-related chat assistant experiment.

Scenarios	GUI-Vid	Tie	VideoChat2
Software	82.7%	13.3%	4.0%
Website	86.0%	12.0%	2.0%
XR	88.0%	8.7%	3.3%
Multi	85.3%	10.0%	8.7%
IOS	92.0%	6.0%	2.0%
Android	82.0%	16.0%	2.0%
Average	86.0%	11.0%	3.7%

- Comparing GUI-world benchmark results with existing benchmarks (Xie et al., 2024; Qinghong Lin et al., 2024; Liu et al., 2024c) shows that stronger understanding ability correlates with better agent performance (Table 17).
- In a human evaluation study using 180 videos across 6 scenarios, annotators preferred responses from GUI-understanding-trained models when acting as GUI agents (Table 9).

MLLM-based Agents for GUI. Building upon the significant advancements in LLMs (Achiam et al., 2023; Meta, 2023a;b; ai, 2024) and advanced modality-mixing technologies (Li et al., 2023a; Alayrac et al., 2022), groundbreaking MLLMs such as GPT-4V (OpenAI, 2023) and Gemini-Pro (Team et al., 2023), along with open-source MLLMs like the LLaVA-1.6 series (Liu et al., 2023b;a), CogVLM (Wang et al., 2023b), and Qwen-VL series (Bai et al., 2023), have shown outstanding performance across various tasks (Yu et al.; Liu et al., 2023e; Chen et al., 2024b; Wu et al., 2023; Wake et al., 2023; Zhang et al., 2024b; Zhao et al., 2024; Gui et al., 2024). Venturing beyond text and single image, several studies are now exploring the integration of video modalities for tasks requiring dynamic or sequential visual content (Jin et al., 2023; Li et al., 2023b; Maaz et al., 2023; Lin et al., 2023a). In the GUI domain, leveraging the robust vision perception capabilities of MLLMs, applications such as WebAgents (Hong et al., 2024; Zhang et al., 2024a; Zheng et al., 2024b) and Mobile Agents (Wang et al., 2023a; You et al., 2024; Wang et al., 2021; Li et al., 2020b) have gained popularity for handling everyday tasks like navigation and VQA. Frontier research is also investigating the use of MLLMs as general control agents, such as in playing computer games (Tan et al., 2024; Lin et al., 2023b) and serving as OS co-pilots (Song et al., 2024; Xie et al., 2024), paving the way for more complex GUI operations.

GUI Benchmark & Dataset. Building upon the foundational work of Rico (Deka et al., 2017), the first mobile GUI video dataset, and AitW (Rawles et al., 2023), which features 715k episodes of sequential images, research has extensively covered mobile (Sun et al., 2022; Li et al., 2020a; Zhang et al., 2023) and web GUI environments (Lù et al., 2024; Zhou et al., 2023; Yao et al., 2022; Koh et al., 2024; Liu et al., 2024b). Mind2Web (Deng et al., 2024) stands out in web-based datasets with over 2,000 tasks from 137 websites across 31 domains. Advances continue into desktop GUIs with new toolkits (Zheng et al., 2024b), benchmarks (Kapoor et al., 2024; Mialon et al., 2023), and frameworks (Zheng et al., 2024a; Liu et al., 2023c; Niu et al., 2024). Research on GUI also transfers from comprehending single images in a static workspace (Hong et al., 2024) to sequential operations or multi-hop scenarios (Xie et al., 2024; Zhang et al., 2024e), challenging the understanding and operation capability of these powerful models.

### 6 CONCLUSION

In this paper, we have introduced GUI-WORLD, a comprehensive GUI-oriented video dataset designed to benchmark and enhance understanding of virtual interfaces, especially sequential and dynamic tasks. This dataset extensively covers six scenarios and various tasks, addressing the previous research gap in comprehensively evaluating models' capabilities in graphic-based understanding. We conduct extensive benchmarks on leading MLLMs and the first video-LLM-based Agent 'GUI-Vid' fine-tuned on GUI-WORLD specifically for GUI-oriented content, achieving results comparable to top-performing models, providing detailed insights into enhancing GUI-related capabilities. We believe our work offers valuable insights for future research in dynamic GUI content understanding.

### A DETAILS OF DATASET CONSTRUCTION

### A.1 SIX MAIN GUI CATEGORIES

In earlier endeavors pertaining to GUI, such as those involving GUI testing (Kousar et al., 2023; Jorge et al., 2014; Kulesovs, 2015), the focus was segmented into GUIs for Website, Software, IOS and Android platforms. However, as a comprehensive GUI dataset, we include all potential GUI scenarios in our dataset to ensure that our data is the most comprehensive knowledge that the GUI Agent needs to learn; we divide these scenarios into six categories:

- Android. This category focuses on the GUI scenarios that occur within the Android operating system, which is predominantly used on smartphones. Android's ubiquity in the mobile market has led to a wide variety of GUI designs and interaction patterns, making it a rich field for study. This category has been the subject of extensive scrutiny in scholarly works such as (Deka et al., 2017; Li et al., 2020a; Rawles et al., 2023; Cheng et al., 2024).
- **Software.** This category encapsulates the GUI scenarios arising within software applications, whether they are standalone programs or components of a larger suite. The diversity of software applications, from productivity tools to creative suites, offers a wide range of GUI scenarios for exploration. The literature is rich with research in this area, such as (Zhan et al., 2024).
- **Website.** This category is concerned with the GUI scenarios that manifest within a web browser. Given the ubiquity of web browsing in modern digital life, this category holds significant relevance. It holds a substantial representation in academic literature, with pioneering papers such as (Deng et al., 2024; Kapoor et al., 2024) proposing excellent GUI datasets for websites.
- IOS. This category zeroes in on the GUI scenarios that transpire within the iOS operating system, the proprietary system for Apple devices like the iPhone and iPad. The iOS platform is known for its distinct design aesthetics and interaction patterns, providing a unique context for GUI research. A number of studies, such as (Beltramelli, 2018; Yan et al., 2023) make use of GUI information in IOS.
- Multi Windows. This category is dedicated to GUI scenarios that necessitate simultaneous interaction with multiple windows, a common occurrence in desktop environments where users often juggle between several applications or documents. Despite the common use of multi-window interaction in everyday GUI usage, there has been relatively little research into this area (Nakajima et al., 2013). The need for efficient multitasking in such scenarios presents unique challenges and opportunities for GUI design and interaction research. As of our knowledge, there are no specific datasets catering to these multi-window GUI scenarios.
- XR. XR encompasses Virtual Reality (VR), Augmented Reality (AR), and Mixed Reality (MR) (Rauschnabel et al., 2022). Given the advancements in XR technology and the growing accessibility of commercial-grade head-mounted displays (Apple, 2024; Met), XR has emerged as a novel medium for human-computer interaction. This necessitates the exploration of GUI within XR environments. In these scenarios, the GUI takes on a 3D, immersive form (Sanders et al., 2019), demanding the agent to comprehend and navigate a 3D space. The emerging field of XR presents a new frontier for GUI research, with unique challenges and opportunities due to its immersive and interactive nature. To date, as far as we are aware, there are no datasets that specifically address GUI in the realm of XR.

### A.2 SELECTED WEBSITE/SOFTWARE

 In our study, we select a diverse range of websites and software to comprehensively evaluate GUI understanding capabilities across various user scenarios. These selections cover essential categories such as social media, productivity tools, online shopping, and educational platforms, providing a broad spectrum of GUI environments.

The chosen websites, as shown in Figure 10, include popular social media platforms like Instagram, Twitter, and LinkedIn, which are integral to understanding dynamic and interactive GUI elements. We also include widely-used productivity tools such as Microsoft Teams, Notion, and Slack to evaluate GUI tasks in professional and collaborative settings.

For software shown in Figure 11, we incorporate key applications like Adobe Photoshop and MAT-LAB to assess GUI operations in specialized and technical environments. Additionally, video conferencing tools like Zoom and cloud storage services like Google Drive are included to represent common remote work and file management scenarios.

These selections ensure that our study encompasses a wide array of user interactions and GUI complexities, thereby providing a robust evaluation of the current state-of-the-art methods in GUI understanding by MLLMs and comprehensively constructing a high-quality dataset.

### A.3 HUMAN KEYFRAMES ANNOTATION PROCESS

Annotator's Information The annotation is conducted by 16 authors of this paper and 8 volunteers independently. As acknowledged, the diversity of annotators plays a crucial role in reducing bias and enhancing the reliability of the benchmark. These annotators have knowledge in the GUI domain, with different genders, ages, and educational backgrounds. The education backgrounds of annotators are above undergraduate. To ensure the annotators can proficiently mark the data, we provide them with detailed tutorials, teaching them how to use software to record videos or edit video clips. We also provide them with detailed criteria and task requirements in each annotation process.

**Recording Video.** For self-recording videos, we employ OBS<sup>3</sup> on the Windows system for screen capturing and the official screen recording toolkit on the Mac/IOS system. This process necessitates human annotators to execute a series of targeted actions within specific websites or applications, which are subsequently captured as raw video footage. **We provide a list of software and website for each annotator to first get familiar with then record video that operating on them. For some popular software or website such as** *chrome***, we ask several annotator to record video of it. These actions, commonplace in everyday usage, enhance the reliability of our dataset. Subsequently, the raw videos are segmented into sub-videos, each encapsulating multiple actions (e.g., clicking a button) to achieve a specific objective (e.g., image search). The videos are then processed to extract keyframes annotated with detailed descriptions.** 

**Edition Based on YouTube Videos.** For sourcing videos from YouTube, we utilize a search protocol formatted as "[website name/application name] + tutorial" to compile relevant video lists. Human annotators first review these videos to understand the primary operations they depict. These videos are then divided into sub-videos, each containing several actions directed towards a single goal (e.g., image search). Like the self-recorded footage, these segments are processed to isolate keyframes and furnish them with descriptive annotations.

**Keyframes Annotation.** After obtaining the GUI video clips, human annotators will filter out the keyframes of the operations based on the video content and the mouse and keyboard actions at that time. They will also label the sub-operations or targets between the two keyframes. Once the annotation is complete, the annotators will provide an overall description of the entire video, summarizing the main goal of the human operations in the video. After all the information is annotated, we will use an LLM to refine the text content, reducing any errors made by human annotators and adjusting the sentence structure. The prompt we use for the LLM to polish the human annotations is shown in Figure 12 and Figure 13.

**Human-LLM Cooperated Instruction Generation.** To curate and refine the golden answer of each video-instruction pair generated by GPT-4V, given that the raw response from GPT-4V may contain

harmful content or hallucinations. The role of humans in the golden answer generation process is to enhance the difficulty of the questions and remove harmful and incorrect content, as shown in Table 11.

Table 11: Comparison of raw answer from GPT-4V and golden answer from humans.

#### Raw response from GPT-4V Golden answer from humans "Q": "What subcategories are visible under the 'Q": "What subcategories are visible under the 'Lifestyle' section in the static GUI content of the 'Lifestyle' section in the static GUI content of the video? video?" "A": "The 'Lifestyle' section of the telegram.com "A": "In the 'Lifestyle' section of the telegram.com website, the visible subcategories are 'Worcester Livwebsite features visible subcategories such as ing', 'Faith', and 'Food'. These are clearly displayed 'Worcester Living', 'Faith', and 'Food'. These are in a horizontal list just below the main 'Lifestyle' prominently shown in a horizontal list beneath the category header, indicating different areas of content main 'Lifestyle' header, offering users various conthat users can explore within the lifestyle section." tent areas to explore within the section."

**Human verifying GPT-4V annotated captions.** We evaluate the quality of annotations from GPT-4V by selecting 1,000 detailed descriptions and captions generated by GPT-4V, which are then assessed by human annotators. The high satisfaction rate of 98% underscores the quality and relevance of the GPT-4V annotations.

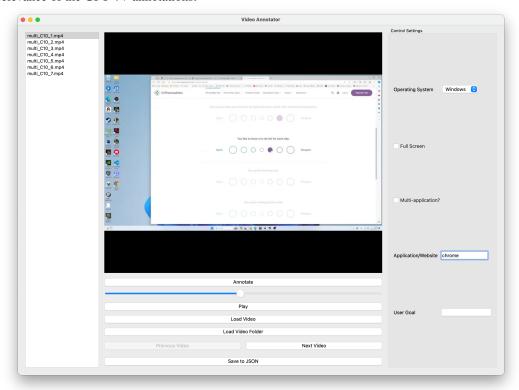

Figure 12: The overall preview of our annotating software.

### B DATASET ANALYSIS

In this section, we provide an analysis of the length distribution of QA in each GUI scenario, as illustrated in Figure 14 and Figure 15. Questions focused on sequential and predictional tasks are slightly longer than other types, while the golden answer of static tasks tends to be longer. Length of Question-answer pair in various GUI scenarios is similarly distributed, with questions in Android environment being slightly shorter, and answers in XR environment being longer.

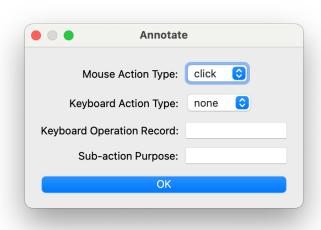

Figure 13: The interface for annotating a keyframe, consists of mouse action, keyboard action, and a short sub-action purpose.

Table 12: Examples of diverse question types in GUI-WORLD.

T.	Question	Examples
Caption	Detailed Description	Q: Please provide a detailed description of what occurs throughout these sequential GUI images.  A: The video shows a user taking the 16 Personalities test on a Windows desktop using the Edge browser
Ca	Summarized Caption	Q: Write a clear description of the video, make sure the key features are well covered.  A: Creating a new IT team in Todoist by selecting industry, job function, role, team size, and inviting members.
0	Layout, Icon Retrieval	Q: What related searches are suggested on the right side of the Bing results for 'emnlp 2024'?  A: The suggested related searches shown include 'emnlp 2024 miami', 'eacl 2024 call for papers'
Static	Textual Retrieval	Q: What is the estimated time to complete the content for Week 2 of the course?  A: The estimated time to complete the content for Week 2 of the course is 1 hour
	Interrelations in GUI Content	Q: What is the name of the browser and the tab where the user performs the product search?  A: The browser is Microsoft Edge, and the user performs the product search in the eBay tab.
	Content Retrieval	Q: What specific action does the user take after turning their head to the left to view the left side of the page?  A: After turning their head to the left to view the left side of the page, the user performs
Dynamic	Prediction	Q: Given the mouse is over 'Add NeurIPS 2024 DB Track Submission,' what's the likely next step?  A: It would be to click on the 'Add NeurIPS 2024 Datasets and Benchmarks Track Submission' button
	Sequential Reasoning	Q: Scrolls down from the 'Moon Gravity', which of the following cheats? A. Change Weather B. Skyfall A: [[B]]

### C DETAILS OF EXPERIMENTS SETUPS

### C.1 FINE-TUNE DATASET CONSTRUCTION

We use two settings to fine-tune GUI-Vid, one with video-text pairs only, and the other with video-text and image-text pairs, which are all GUI content:

- Video Only. In this setting, we only train GUI-Vid with video-text pairs in GUI-WORLD, as shown in Table 13.
- Video-Image. Inspired by the pre-trained process of Videochat2, we include image-text pairs to
  help the visual encoder align GUI knowledge. These images are selected from our GUI-WORLD,
  MetaGUI (Sun et al., 2022), and OmniAct (Kapoor et al., 2024) for high-quality GUI content.
  Subsequently, we use GPT-4V to generate a detailed description and a concise caption for each
  image. Finally, we construct a dataset consisting of video-text and image-text pairs for gaining
  comprehensive GUI-oriented capabilities.

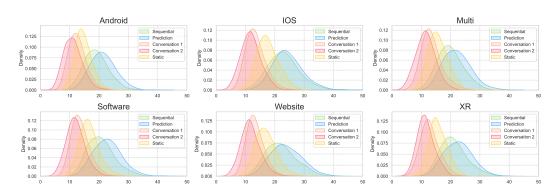

Figure 14: Length distribution of free-form questions.

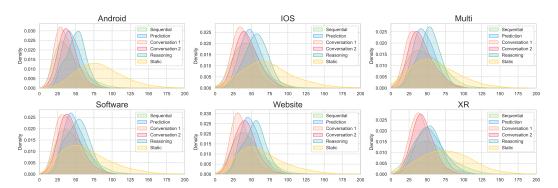

Figure 15: Length distribution of answers to free-form questions.

### C.2 Hyperparameter Settings

In this section, we will introduce the hyperparameters of MLLMs to facilitate experiment reproducibility and transparency. We divide them into three parts: the inference phase during benchmark and dataset construction, the LLM-as-a-Judge phase, and the fine-tuning phase. All our experiments were conducted on a server equipped with dual A800 and dual 4090 GPUs.

**Inference.** We empirically study 7 MLLMs, involving 4 Image-LLMs and 3 Video-LLMs, with their hyperparameters detailed as follows:

- **GPT-4V** (**OpenAI**, **2023**) & **GPT-4o** (**OpenAI**, **2024**): We set the temperature and top-p as 0.9, max-token as 2048, and both all images input are set as high quality in *Instruction Dataset Construction* and benchmarking.
- Gemini-Pro-1.5 (Team et al., 2023): We use the default settings, which set temperature as 0.4, top-p as 1, and max-token as 2048. It should be noted that during our project, Gemini-Pro-1.5 is still under the user request limit, which only provides 100 requests per day, making our benchmark difficult. Given that Gemini hasn't launched Pay-as-you-go<sup>4</sup>, we will include benchmark results on 'Human' setting as soon as possible.
- Qwen-VL-Max (Bai et al., 2023): We use the default settings for Qwen-VL-Max, with top-p as 0.8 and max-token as 2048. Given that the input context window is merely 6,000 for Qwen, we scale the resolution for all images to 0.3.
- ChatUnivi (Jin et al., 2023): We use ChatUnivi-7B built upon Vicuna-v0-7B and set the max frame as 100, temperature as 0.2, and max-token as 1024.
- Minigpt4video (Ataallah et al., 2024): We use the suggested settings<sup>5</sup> for this model and the max-frame are set as 45, with only the max-token being modified to 1024.

<sup>4</sup>https://ai.google.dev/pricing

<sup>&</sup>lt;sup>5</sup>https://github.com/Vision-CAIR/MiniGPT4-video

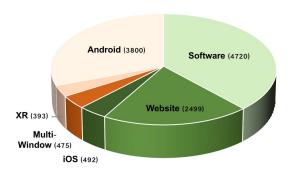

Figure 16: Statistic of different GUI scenarios in GUI-WORLD.

Table 13: Video-only fine-tune dataset.

Stage	Data types	Amount
1	Detailed Description Concise Caption	14,276 7,138
2	GUI VQA Multiple-Choice QA Conversation	21,414 14,276 7,138

• VideoChat2 & GUI-Vid (Li et al., 2023c): For a fair comparison, we set the same hyperparameters for VideoChat2 & GUI-Vid. We set the max-token as 1024, top-p as 0.9, temperature as 1.0, max-frame as 8/16, repetition penalty as 1.2, and length penalty as 1.2.

**LLM-as-a-Judge.** We investigate four LLM-as-a-Judge in giving a similarity score for the MLLM's response and ground truth, namely GPT-4 (Achiam et al., 2023), ChatGPT (OpenAI, 2023), LLaMA-3-70b-instruct (Meta, 2023b), and Mixtral-8x22b-instruct-v0.1 (ai, 2024). Hyperparameter settings are detailed as follows:

- GPT-4 & ChatGPT. We set the temperature as 0.6 and others as default.
- LLaMA-3-70b-instruct. We set the temperature as 0.6, top-p as 0.9, top-k as 50.
- Mixtral-8x22b-instruct-v0.1. We set top-p as 0.7, top-k as 50, and temperature as 0.7.

**Fine-tune.** We include several hyperparameter settings in experiment settings and ablation studies, as shown in Table 15.

### C.3 EVALUATION.

Given the complexity of free-form answers in GUI scenarios, the evaluation includes specific positions of GUI elements, textual content, and comparing the response to the golden answer. LLM-as-a-Judge has been widely used in previous studies for complex evaluation tasks (Zheng et al., 2023; Liu et al., 2023d). Therefore, we leverage LLM-as-a-Judge (Zheng et al., 2023) in a similar setting to MM-vet (Yu et al.), which compares the MLLM's response to the golden answer. We carefully evaluate the accessibility of leveraging LLM-as-a-Judge, selecting 1,000 samples covering 6 free-form questions mentioned in our dataset. As shown in Table 16, GPT-4 outperforms other LLMs, exhibiting a better human alignment on providing a similarity score for the response compared to the golden answer, although it is approximately 10 times more expensive than other models.

### D ADDITIONAL EXPERIMENTS RESULTS

In this section, we first provide an ablation study on keyframe selection methods. Then, we conduct statistics and human preference experiments on correlations of GUI understanding capability to other

mainstream GUI-related tasks. Furthermore, we provide detailed, performance on newly released models after our submission of the first version, followed by very detailed results on each task in each GUI scenario.

**Ablation study on keyframe identify methods.** Firstly, we show performance on model-based keyframe identify methods in Table 6, with details of UVD+VIP and UVD+R3M in Table 20 and Table 21.

Correlation between GUI understanding and other mainstream GUI tasks. Furthermore, we conduct additional analysis and experiments to show how GUI understanding capability helps mainstream GUI-related tasks, including generating code to operate GUI (Cheng et al., 2024) and assist people through chat (Hong et al., 2024). Both demonstrate the strong correlation between GUI understanding capability and specific tasks for GUI agents.

• We compare the benchmark results on GUI-world with existing benchmarks (Xie et al., 2024; Qinghong Lin et al., 2024; Liu et al., 2024c) for operating on GUI as shown in Table 17, and find that the results generally match, i.e., the stronger the understanding ability, the stronger the agent performance.

Table 16: Evaluating LLM-as-a-Judge as a replacement for human judging in the scoring setting.

Models	Pearson(†)	Spearman(↑)	$Kendall(\uparrow)$	\$ per Benchmark(↓)
GPT-4	0.856	0.853	0.793	120\$

Model	GUI-World	VisualAgentBench	VideoGUI	OS-World
GPT-40	1	1	1	2
GPT-4V	2	2	2	1
Gemini-1.5-Pro	3	3	3	3
Qwen-VL-Max	4	4	4	/

• For the definition of chat helping humans, we select 180 videos from the benchmark, choosing 30 videos for each scenario. We ask 5 human annotators to pose the question they most wanted to ask after watching each video. We then use GUI-Vid, both before and after fine-tuning, to answer these questions. The human annotators who ask the questions are then asked to indicate which answer is more helpful. The results are shown in Table 9, demonstrating that models trained in GUI understanding are more favored by people when acting as GUI agents.

**Performance of newly released models in GUI-WORLD test set.** We evaluate two latest models, LLaVA-Next-Video-7B-DPO (Liu et al., 2024a) and Video-LLaVA (Lin et al., 2023a). We show their performance in Table 19 and Table 18. Our model outperforms these in most tasks, except conversation, likely due to their use of DPO during training.

For captioning tasks, Table 22 shows comprehensive experimental results among six scenarios. For scores of LLM-as-a-Judge in a specific task, see Table 23, Table 24, Table 25, Table 26, and Table 27. For performance in fine-grain (application level), see Figure 17 for Gemini-Pro and Figure 18 for Qwen-VL-Max.

### E PROMPTS

In this section, we provide detailed prompts for models and human annotators. Figure 20 shows the guideline of human annotation, Figure 19 shows the prompt for leveraging LLMs to refine grammarly mistakes and polish sentence for human annotations. Figure 21, Figure 22, and Figure 23 present the prompt for Human-MLLM collaboration method to generate GUI-orientaed tasks. Figure 24 illustrate the prompt for benchmarking MLLMs, different GUI scenarios and different QA type has different prompt. Figure 25 and Figure 26 show prompt for LLM-as-a-Judge for free-form as well as conversational tasks and multiple-choice QA respectively.

### Refining Human Annotation on Goal and Sub-goal

As an expert in English, please refine the following English instructions (or objectives) into a polished phrase or a concise sentence.

Avoid including irrelevant content and provide the polished output directly.

Here is the English sentence: {string}

Figure 19: Refining Human Annotation on Goal and Sub-goal.

1728 **Guideline for Human Annotation** 1729 1730 Main Interface Video List Panel (Left Panel): Displays a list of loaded 1731 video files. Each video file is shown with its name for 1732 identification. 1733 2. Video Display Area (Center Panel): Shows the currently 1734 selected video for playback and annotation. 1735 3. Control Settings (Right Panel): 1736 Operating System: Select the operating system of the machine 1737 where the video was recorded. 1738 Full Screen: Toggle full screen mode for the video display. 1739 Multi-application?: Indicate if multiple applications in the 1740 video. 1741 Application/Website: Enter the name of the application or website being used in the video. 1742 User Goal: Enter the goal of the user performing the 1743 annotation. 1744 4. Playback and Annotation Controls (Bottom Panel) 1745 Annotate: Open a annotation window to add a new keyframe 1746 annotation. 1747 Play: Starts or pauses the video playback. 1748 Load Video: Allows you to load a single video file. 1749 Load Video Folder: Allows to load multiple video files from 1750 a folder. 1751 Previous Video / Next Video: Navigate through the loaded 1752 video files. Save to JSON: Save the annotations in a JSON format. 1753 Annotation Window 1754 1. Mouse Action: Select a type of mouse action (e.g. 1755 drag). 1756 2. Keyboard Action: Select the type of keyboard action 1757 (e.g., typing, key press). 1758 3. Keyboard Operation Record: Enter details of the keyboard 1759 operation, if any. 1760 4. sub-action Purpose: Describe the purpose of the action 1761 being annotated. How to Use 1762 1763 Loading Videos 1. Load Multiple Videos Click on the Load Video Folder button. 1765 Select the folder containing your video files. 1766 All video files in the folder will be loaded and listed in 1767 the Video List Panel. 1768 Playing Videos 1769 Select a video from the Video List Panel. Click the Play 1770 button to start or pause the video. 1771 Annotating Videos 1772 Start Annotation 1773 Pause the video at the desired frame. 1774 Click the Annotate button to open the annotation window. 2. Annotation Window 1775 Select the Mouse Action Type and Keyboard Action Type from 1776 the dropdown menus. 1777 If there is a keyboard action, enter the details in the 1778 Keyboard Operation Record field. 1779 Describe the action's purpose in the Sub-action Purpose 1780 field. 1781 Click OK to save the annotation. Saving Annotations Once all annotations are completed, click the Save to JSON

33

button.

#### 1782 (Part 1) GPT-4V Generating GUI-oriented Tasks 1783 1784 You are an AI visual assistant. This is a video of a mobile GUI, which I've divided into multiple frames and sent to 1785 you. Please provide a detailed description of what occurs 1786 throughout the entire video, focusing on the changes in the 1787 GUI elements or scenes rather than static aspects of a single 1788 frame. The detailed description should be placed under the 1789 key 'Description'. Based on your description, please design 1790 the following tasks: 1791 Generate a precise caption for the video. This caption 1792 should encapsulate the main activities or changes observed 1793 throughout the video sequence. Place this caption under the 1794 key 'Caption'. 1795 Create a free-form QA question related to the video's static 1796 GUI content, along with its answer. The question should delve into the details or changes in the static GUI elements 1797 or scenes captured in the video. The QA task should be 1798 nested under the key 'static QA', with 'Question' and 'Answer' 1799 as subkeys. 1800 Develop a multiple-choice QA question about the video, 1801 with four options: one correct answer and three incorrect 1802 or irrelevant options. This task should assess the 1803 understanding of specific elements retieval or changes depicted in the video. Structure this task under the key 1805 'MCQA', with 'Question' detailing the query, 'Options' listing the four choices including one correct answer, and 'Correct 1807 Answer' specifying the correct option, denoted, for example, as $\{[[B]]\}.$ 1808 Here are some key information of the video to help you 1809 understand the video comprehensively: 1810 System: {item['system']} 1811 Application: {item['app']} 1812 Summary of the video: {item['goal']} 1813 Key Operation/Sub goal in the video: {[i['sub\_goal'] for i in 1814 item['keyframes']]} 1815 Notice: Ensure that the questions you design for these tasks 1816 are answerable and the answers can be deduced from the GUI 1817 video content. The answerable question should be designed 1818 as difficult as possible. The tasks should be unambiguous and the answers must be definitively correct based on your 1819 understanding of the video content. Only include questions 1820 that have definite answers: (1) one can see the content 1821 in the image that the question asks about and can answer 1822 confidently; (2) one can determine confidently from the image that it is not in the image. Do not ask any question that 1824 cannot be answered confidently. 1825 Each of these tasks should focus on the dynamic aspect of 1826 the GUI elements or scenes. Provide detailed answers when 1827 answering complex questions. For example, give detailed examples or reasoning steps to make the content more convincing and well-organized. The answers should be in a tone that a visual AI assistant is seeing the image and 1830 answering the question. 1831 For the free-form QA tasks, please ensure that the answers 1832 are as detailed and lengthy as possible, with no concern for 1833 length. You can include multiple paragraphs if necessary 1834

to provide a comprehensive and thorough response. Please

mentioned in the task requirements.

structure your response using JSON format and specific keys

1841
1842
                      (Part 2) GPT-4V Generating GUI-oriented Tasks.
1843
        You are an AI visual assistant.
                                          This is a video of a <Scene
1844
        Name > GUI, which I've divided into multiple frames and sent
1845
        to you. Please provide a detailed description of what occurs
1846
        throughout the entire video, focusing on the changes in the
1847
        GUI elements or scenes rather than static aspects of a single
1848
        frame.
                The detailed description should be placed under the
1849
        key 'Description'. Based on your description, please design
1850
        the following tasks:
1851
        A Sequential QA task: Design a question that requires
1852
        understanding the sequence of GUI element changes or scene
        transformations in the video. The question should be
        free-form and necessitate the use of temporal information
1854
        from the sequential images. The task should be structured
1855
        under the key 'Sequential-QA' with subkeys 'Question' and
1856
        'Answer'.
1857
        A Next Stage Prediction task: Formulate a question that asks
1858
        about the subsequent state or event following a certain frame
1859
        in the video. The question should be designed in a free-form
1860
        manner and predict future GUI elements or scene changes,
1861
        structured under the key 'Prediction' with subkeys 'Question'
1862
        and 'Answer'.
1863
        A two-round dialogue task: Create a dialogue with two rounds
1864
        of interaction. The first round includes a user instruction
        and an assistant response, and the second round's user
1865
        instruction should be based on the response from the first
1866
        round. Both rounds should be free-form and nested under the
1867
        key 'Conversation', with subkeys 'User 1', 'Assistant 1',
        'User 2', and 'Assistant 2'.
        A reasoning task: Design a multi-choice QA task that
1870
        requires reasoning to identify the correct answer from four
1871
        options. This task should test the reasoning ability to
1872
        infer or deduce information that is not explicitly provided.
1873
        It should be structured under the key 'Reasoning', with
1874
        subkeys 'Question', 'Options', and 'Correct Answer'.
        Here are some key information of the video to help you
1875
        understand the video comprehensively:
1876
        System: {item['system']}
1877
        Application: {item['app']}
1878
        Summary of the video: {item['goal']}
1879
```

#### Prompt for LLM-as-a-Judge: Judging Free-form and Conversational Tasks

You are an impartial judge. I will provide you with a question, a 'gold standard' answer, and a response that needs evaluation. Your task is to assess the quality of the response in comparison to the 'gold standard' answer. Please adhere to the following guidelines:

1. Start your evaluation by comparing the response to the 'gold standard' answer. Offer a brief explanation highlighting similarities and differences, focusing on relevance, accuracy, depth, and level of detail.

 2. Conclude your evaluation with a score from 1 to 5, where 1 indicates the response is mostly irrelevant to the 'gold standard' answer, and 5 indicates it is very similar or equivalent.

3. Present your findings in JSON format, using 'Evaluation' for your textual analysis and 'Score' for the numerical assessment.

4. Ensure objectivity in your evaluation. Avoid biases and strive for an even distribution of scores across the spectrum of quality. Your scoring must be as rigorous as possible and adhere to the following rules:

- Overall, the higher the quality of the model's response, the higher the score, with factual accuracy and meeting user needs being the most critical dimensions. These two factors largely dictate the final composite score.

- If the model's response is irrelevant to the question, contains fundamental factual errors, or generates harmful content, the total score must be 1.

- If the model's response has no severe errors and is essentially harmless, but of low quality and does not meet user needs, the total score should be 2.

- If the model's response generally meets user requirements but performs poorly in certain aspects with medium quality, the total score should be 3.

- If the model's response is close in quality to the reference answer and performs well in all dimensions, the total score should be 4.

- Only when the model's response surpasses the reference answer, fully addresses the user's problem and all needs, and nearly achieves a perfect score in all dimensions, can it receive a score between 5.

- As an example, the golden answer could receive a 4-5.

Here is the response for you to judge:
Question: {question}

Golden Answer: {golden\_answer}
Response: {response}

Now, directly output your response in json format.

2058
         You are a helpful assistant tasked with judging a Multiple
        Choice Question Answering exercise.
2059
        I will provide a correct answer with only one option, and a
2060
        response that requires evaluation.
2061
        If the response matches the correct answer, simply output
2062
        "Yes"; If it does not, output "No".
2063
        Please avoid including any irrelevant information.
2064
        Here are some examples:
2065
2066
        Example 1:
2067
        Question: Based on the GUI video, why might the 'Loading'
2068
        animation continue without reaching the next stage? A. The
2069
        user has not yet entered their login credentials. B. There
2070
        is a system update being installed. C. The server is taking
        time to authenticate the login credentials. D. The 'Log In'
2071
        button is malfunctioning.
2072
        Answer: C
2073
        Response: C. The server is taking time to authenticate the
2074
        login credentials.
2075
        Output: Yes
2076
2077
        Example 2:
2078
                   If the user wants to resume the group video call
        Question:
2079
        after checking messages, what action should they take? A.
2080
        Turn their head to the right. B. Close the messaging app
        interface. C. Say a voice command to switch applications.
2081
        Turn their head to the left.
2082
        Answer: A
2083
        Response:
2084
        Output: No
2085
2086
        Example 3:
        Question:
                   What action does the user take to start playing
        music in the video? A. Closed the music player application B.
2089
        Moved the music player to a new position C. Clicked the play
2090
        button D. Adjusted the system volume
2091
        Answer: [[B]]
        Response:
2092
        Output: No
2093
2094
        Here is the question, answer, and response for you to judge:
2095
        Question: {question}
2096
        Answer: {answer}
2097
        Response:
                   {response}
2098
        Now, directly output "Yes" or "No".
2099
```

#### (Part 1) Android

'Description1': "The video starts with a view of a mobile app interface, specifically an Al-Qur'an Indonesia app with a list of Surahs. A user scrolls through the Surah list, selects a specific Surah, and the view transitions to a page displaying the verses in Arabic and their Indonesian translation. The user then returns to the Surah list. Following this, a pop-up appears indicating a configuration process that takes approximately 10-20 seconds. After the configuration, another pop-up notifies of an available update from the Google Play Store, which the user can accept or postpone. The user dismisses this pop-up. The main menu is accessed, showing options such as 'Baca Quran', 'Terakhir Baca', 'Pencarian', 'Jadwal Sholat', and 'Pengaturan'. The user selects the 'Pencarian' option, which leads to a search page. Here, the user is instructed to enter a keyword to search in the translation database. Finally, the user navigates back to the main menu and then to the Surah list once more."

'Sequential-QA': 'Question': 'After selecting a specific Surah from the list, what does the user do next before a pop-up notification appears?'

'Answer': 'After selecting a Surah, the user views the verses in Arabic and their Indonesian translation. Then, the user returns to the Surah list before a pop-up notification appears.'

'Prediction': 'Question': 'What would likely be the next step in the app interface after the user is directed to the search page?'

'Answer': "After being directed to the search page, the likely next step would be for the user to enter a keyword into the search bar to find a translation or meaning within the app's database."

'Conversation': 'User 1': 'I need to find a specific verse
in the Quran. How do I search for it?'

'Assistant 1': "You can search for a specific verse by tapping on the 'Pencarian' option in the main menu, which will take you to a search page where you can enter a keyword."

'User 2': 'I see. And how do I get back to the main menu from the search page?'

'Assistant 2': 'To return to the main menu from the search page, you can tap on the back arrow located at the top left corner of the screen.'

'Reasoning': 'Question': "If the user wants to read the verses of Surah 'Al-Infitar', what should they do after launching the app?"

'Options': ["A. Go to the settings and select 'Al-Infitar'.",
"B. Scroll through the Surah list and select 'Al-Infitar'.",
"C. Choose the 'Pencarian' option and type 'Al-Infitar'.", "D. Wait for a pop-up and select 'Al-Infitar' from there."]
'Correct Answer': "B. Scroll through the Surah list and select 'Al-Infitar'."

(Part 2) IOS 'Description2': "The video begins with the user viewing the 'Computers and the Internet' course section within the Khan Academy application. The user scrolls through various subsections such as 'Digital information,' 'Computers,' 'The Internet,' and 'Online data security, $^{\prime}$  each with a list of topics and a status of possible mastery points. The user continues to scroll down to the 'Computing innovations' section and then further down to a 'Course challenge' prompt. The user then scrolls back up, revealing previously seen sections in reverse order. The user eventually navigates back to the main 'Computing' category screen, showing an overview of all computing-related courses. From there, the user selects 'Computer science theory,' which briefly loads before displaying topics within that course such as 'Cryptography' and 'Information theory.' Following this, the user returns to the main 'Computing' category screen." 'Sequential-QA': 'Question': "What action does the user take after scrolling through the 'Online data security' section, and what is displayed as a result of this action?", 'Answer': "After scrolling through the 'Online data security' section, the user scrolls down to the 'Computing innovations' section. As a result of this action, topics such as 'Communication innovations', 'Collaboration innovations', . Crowdsourcing innovations', and ·Monitoring innovations' are displayed, followed by a ·Course challenge' prompt." 'Prediction': 'Question': "If the user were to select the 'Cryptography' section after it was displayed, what kind of content could you predict will be shown next?" 'Answer': "If the user selects the 'Cryptography' section, one could predict that the next content shown would be detailed topics under Cryptography, such as 'Ancient cryptography,' 'Ciphers,' 'Cryptography challenge 101,' 'Modern cryptography,' 'Modular arithmetic,' 'Primality test,' and 'Randomized algorithms,' along with the status of possible mastery points for that section." 'Conversation': 'User 1': 'Can you take me to the section about user authentication methods?' 'Assistant 1': "Sure, you will need to scroll down the 'Computers and the Internet' course section until you reach the 'Online data security' subsection, where you will find the topic 'User authentication methods." 'User 2': "I scrolled too far down and reached the course challenge. How do I find 'User authentication methods' from here?" 'Assistant 2': "No problem, you'll need to scroll back up past the 'Computing innovations' section until you see the 'Online data security' subsection again. 'User authentication methods' is listed there among other topics." 'Reasoning': 'Question': "After browsing through the course topics in 'Computers and the Internet,' the user returns to a broader category view. Based on this behavior, what could be the reason for the user returning to the broader category view?" 'Options': ['A. The user wants to take a course challenge.', 'B. The user is looking for a different computing-related course.', 'C. The application automatically redirected the user.', 'D. The user intends to log out of the Khan Academy application.'] 'Correct Answer': 'B'

## (Part 1) Multiple-Windows Interaction

'Description1': "The video begins with a Windows desktop displaying multiple open applications, including Steam, OBS Studio, and a web browser with NVIDIA's website loaded. The user starts by clicking on the back page of the browser, which partially obscures the OBS window. Then, the user clicks on the OBS application, bringing it to the forefront. The user minimizes OBS, followed by dragging the Steam window to the center of the screen and minimizing it as well. A new web page is opened in the Edge browser's navigation bar, and the user types 'office' into the search bar. The browser navigates to the Bing search interface, and 'office' is successfully searched."

'Caption': 'Navigating and Managing Multiple Applications on Windows Including Steam, OBS Studio, and Edge Browser' 'static QA': 'Question': "Which web browser is used in the video and which website is prominently featured before the search for 'office'?"

'Answer': "The web browser used in the video is Microsoft Edge. The prominently featured website before the search for 'office' is NVIDIA's official website where the 'Download Drivers' page is displayed."

'MCQA': 'Question': 'What action is taken after the OBS
application is minimized?', 'Options': ['A. The Steam window
is closed.'

'B. The Steam window is moved to the center of the screen and minimized.', 'C. The Edge browser is closed.', 'D. A file is opened from the desktop.']

'Correct Answer': '[[B]] The Steam window is moved to the center of the screen and minimized.'

Figure 31: Case study for multiple-windows interaction (part 1).

2430 2431 (Part 2) Multiple-Windows Interaction 2432 2433 2434 2435 2436 2437 2438 2439 2440 2441 'Description2': "The video shows a Windows desktop with several 2442 application windows open, including Steam, OBS, and Edge. Initially, 2443 the OBS window is partially covering the Edge browser. The user clicks on the Edge browser, bringing it to the foreground, and 2444 then minimizes the OBS window, clearing the view. Next, the user 2445 moves the Steam window to the center of the screen and minimizes 2446 it as well. Afterward, the user opens a new tab in Edge and enters 2447 'office' into the search bar, which leads to a Bing search results 2448 page for 'office'. The video ends with the user on the Bing search 2449 page with 'office' results displayed." 2450 'Sequential-QA': 'Question': 'After moving the Steam window to the 2451 center, what did the user do next in the Edge browser?' 2452 'Answer': "After moving the Steam window to the center, the user 2453 minimized the Steam application. Then, they opened a new tab in the Edge browser and entered 'office' into the search bar, which led 2454 them to the Bing search results page for 'office'." 2455 'Prediction': 'Question': "What would be the likely next action 2456 the user performs after searching for 'office' on Bing?" 2457 'Answer': "The likely next action the user would perform after 2458 searching for 'office' on Bing would be to click on one of the 2459 search results to find more information or to visit the Microsoft 2460 Office website to purchase or learn more about the office suite." 2461 'Conversation': 'User 1': 'Can you minimize the OBS application 2462 for a better view of the browser?' 2463 'Assistant 1': 'Certainly, the OBS application has been minimized, 2464 providing a clear view of the Edge browser.' 'User 2': 'Great, now can you search for Microsoft Office in the 2465 Edge browser?' 2466 'Assistant 2': "Of course, a new tab has been opened in the Edge 2467 browser and 'office' has been entered into the search bar. The Bing 2468 search results for 'office' are now displayed." 2469 'Reasoning': 'Question': 'If the user needs to record gameplay 2470 footage next, which application should they interact with and what 2471 would be their first step?' 2472 'Options': ["A. They should open the Steam application and click on 2473 the 'STORE' tab.", "B. They should open the Edge browser and search 2474 for 'game recording software'.", "C. They should reopen the OBS 2475 application and click on the 'Start Recording' button.", "D. They should access the Windows Start menu and search for the 'Camera' 2476 app."] 2477 'Correct Answer': 'C' 2478 2479

Figure 32: Case study for multiple-windows interaction (part 2).

(Part 1) Software 'De scription1': "The video shows a Python 3.7.4 Shell window on a Windows system. The user begins by typing the 'print' function followed by a pair of parentheses. Inside the parentheses, the user types a string, 'Hello World', which is enclosed in double quotes. Upon pressing Enter, the Python Shell executes the command and outputs the text 'Hello World' below the command line, indicating that the code ran successfully without any errors." 'Caption': "Executing the print command in Python Shell to display 'Hello World'" 'static QA': "Question": "What version of Python is shown running in the video?" "Answer": "The version of Python running in the video is Python 3.7.4, as indicated by the text at the top of the Python Shell window." 'MCQA': "Question": "What operation does the user perform after typing the print command?" "Options": ["A. The user saves the file.", "B. The user compiles the code.", "C. The user executes the print command.", "D. The user closes the Python Shell."] "Correct Answer": "[[C]] The user executes the print command."

Figure 33: Case study for software (part 1).

2538 (Part 2) Software 2539 2540 2541 2542 2543 2544 2545 5 2546 2547 2548 2549 'De 2550 scription2': "The video shows a sequence of a user interacting 2551 with the Python Shell on a Windows system. Initially, the shell 2552 is open and waiting for input. The user begins by typing 'print\*' 2553 and then corrects the typo by removing the asterisk, typing 'print'. 2554 They then type two quotation marks to prepare for a string input. 2555 Subsequently, the user moves the cursor between the quotation marks 2556 and types 'Hello World' to complete the 'print (Hello World)' command. 2557 After pressing enter, the shell executes the command, and the phrase 2558 'Hello World' is outputted below the command prompt." 2559 'Sequential-QA': "Question": "Can you describe the sequence of 2560 actions the user took to correct the command and output 'Hello 2561 World'?" "Certainly. Initially, the user typed 'print\*' but "Answer": realized the asterisk was a mistake. They deleted the asterisk to 2563 correct the command to 'print'. Next, they entered two quotation 2564 marks to indicate the start of a string. The user then placed 2565 the cursor between the quotation marks and typed the string 'Hello 2566 World'. Finally, upon pressing enter, the Python Shell executed the 2567 command and displayed the output 'Hello World' beneath the command 2568 prompt." 2569 'Prediction': "Question": "What would be the expected GUI change 2570 if the user were to type another command after the 'Hello World' 2571 output?" 2572 "Answer": "If the user were to type another command after the 'Hello World' output, the expected GUI change would be that the 2573 command prompt indicator '>>>' would appear on a new line below the 2574 'Hello World' output, signaling readiness for the next command input. 2575 Any subsequent command typed by the user would appear after this new 2576 prompt, awaiting execution." 2577 'Conversation': "User 1": "I want to print a different message in 2578 Python. How can I do that?", "Assistant 1": "To print a different 2579 message, you can simply type 'print (Your Message Here)' where 2580 'Your Message Here' is the text you wish to print. Make sure you 2581 enclose your message in quotation marks and hit enter to execute the 2582 command." "What if I want to print 'Goodbye, World' instead?" "User 2": 2583 "Assistant 2": "To print 'Goodbye, World', you would type 2584 'print (Goodbye, World)' and press enter. The Python Shell will 2585 execute the command and display 'Goodbye, World' as the output below 2586 the command prompt." 2587 'Reasoning': "Question": "What command did the user execute to get 2588 the output in the Python Shell?" 2589 "Options": ["A. print(Hello World)", "B. print(Hello World)", "C. 2590 print (Hello World)", "D. echo (Hello World)"]

"Correct Answer": "C",

scription2': "The video starts with a full-screen view of a browser interface titled 'Apple Vision Pro' displaying various website thumbnails and bookmarks. The user then turns their head to the right, causing the right side of the browser to come into view. Next, the user looks at a dot at the bottom of the page and pinches with both hands, which causes the browser to exit the full-screen view and shrink to a smaller, windowed mode. The user then performs a pinching motion with both hands, bringing the fingers towards the middle, which causes the browser's various pages to expand, giving an overview of multiple open tabs. The user again turns their head to the right to view the right side page and then to the left to view the left side page. Throughout the video, the GUI elements such as tabs, the address bar, and website thumbnails respond dynamically to the user's head movements and hand gestures." 'Sequential-QA': 'Question': 'What action did the user take immediately after turning their head to the right to view the right side page?'

'Answer': 'After turning their head to the right to view the right side page, the user looked at a dot at the bottom of the page and pinched with both hands, which caused the browser to exit full-screen mode and shrink to a smaller windowed interface.'
'Prediction': 'Question': 'If the user pinches with both hands and moves their fingers towards the middle after the browser shrinks to a smaller window, what will happen next?'

'Answer': "If the user pinches with both hands and moves their fingers towards the middle after the browser shrinks, the action will cause the browser's various pages to expand, providing an overview of multiple open tabs."

'Conversation': 'User 1': 'How do I view all the pages I have open
in the browser?'

'Assistant 1': 'You can view all the open pages by pinching with both hands and moving your fingers towards the middle. This will expand the browser and show an overview of all the open tabs.'
'User 2': 'Great, and how can I exit this overview?'

'Assistant 2': 'To exit the overview of open pages, you can look at the dot at the bottom of the page and pinch with both hands. This will exit the overview and return you to the individual page view.'

'Reasoning': 'Question': 'How can the user access the options to open a new tab or window from the current state?'

'Options': ['A. Turn their head to the left and select the plus sign.', 'B. Swipe left on the touchpad.', 'C. Turn their head to the right and select the 'Done' button.', 'D. Pinch with both hands to exit the current view and access the toolbar.']

'Correct Answer': 'D'
