In-Context Principle Learning from Mistakes

Anonymous Authors¹

Abstract

In-context learning (ICL, also known as fewshot prompting) has been the standard method of adapting LLMs to downstream tasks, by learning from a few input-output examples. Nonetheless, all ICL-based approaches only learn from 015 correct input-output pairs. In this paper, we revisit this paradigm, by learning more from the few given input-output examples. We intro-018 duce Learning Principles (LEAP): First, we intentionally induce the model to make mistakes 020 on these few examples; then the model itself reflects on these mistakes, and learn explicit taskspecific "principles" from them without any human supervision, which help solve similar problems and avoid common mistakes; finally, we 025 prompt the model to answer unseen test questions using the original few-shot examples and these learned general principles. We evaluate 028 LEAP on a wide range of benchmarks, including 029 multi-hop question answering (Hotpot QA), tex-030 tual QA (DROP), Big-Bench Hard reasoning, and math problems (GSM8K and MATH); in all these benchmarks, LEAP improves the strongest available LLMs such as GPT-3.5-turbo, GPT-4, 034 GPT-4-turbo and Claude-2.1. For exam-035 ple, LEAP improves over the standard few-shot prompting using GPT-4 by 7.5% in DROP, and by 3.3% in HotpotQA. Importantly, LEAP does not require any more input or examples than the 039 standard few-shot prompting settings.

1. Introduction

041

053

The rise of large language models (LLMs; Radford et al., 2019; Chowdhery et al., 2022; Zhang et al., 2022; Li et al., 2022; Anil et al., 2023; Touvron et al., 2023;b) that are too costly to finetune for downstream tasks has led to the growing popularity of *in-context learning* (ICL), also known

Learned Principle	Benchmark
When solving a problem involving multiple sources of income and expenses, it is crucial to keep track of each component separately and calculate the total accurately.	GSM8K
When simplifying complex numbers raised to powers, it is important to remember the following rules: (1) $i^2 = -1$ (2) $i^3 = -i$ (3) $i^4 = 1$ (4) $i^{-1} = \frac{1}{i} = -i$	MATH
Perform calculations using the full precision available and only round as a final step, if necessary.	DROP
When answering questions about commonal- ities between two entities, it is important to consider all relevant aspects and not just the most obvious or prominent one.	HotpotQA
Double negation, as in 'not not', cancels out and returns the original value.	Boolean Expr- essions (BBH)
Sarcasm often involves saying the opposite of what is meant Paying attention to the incongruity between the literal meaning of the words and the intended meaning can help in accurately identifying sarcasm.	Snarks (BBH)

Figure 1: Examples for learned principles using LEAP, with key idea of each principle highlighted.

as few-shot prompting (Brown et al., 2020; Liu et al., 2023; Wei et al., 2023). In in-context learning, the LLM is provided with a few (e.g., three) input-output task-specific examples in its prompt, along with an unseen test input. Using this emergent ability (Wei et al., 2022b), the LLM is then expected to generate output for the test input. The LLM generates this output by implicitly learning the task from the few given examples, at inference time.

ICL was shown to be extremely effective and data-efficient across a variety of tasks and domains (Min et al., 2022a; Alayrac et al., 2022; Liu et al., 2021; Lu et al., 2023), mainly because it allows for downstream task-adaptation without training. Further, ICL enables generalization using only a few annotated examples. Nonetheless, all ICL-based approaches only learn from *correct* input-output pairs (Min et al., 2022b); in contrast, learning from *mistakes* is a foundational aspect of the way humans learn (Edmondson, 1996;

Preliminary work. Under review by the International Conference on Machine Learning (ICML). Do not distribute.

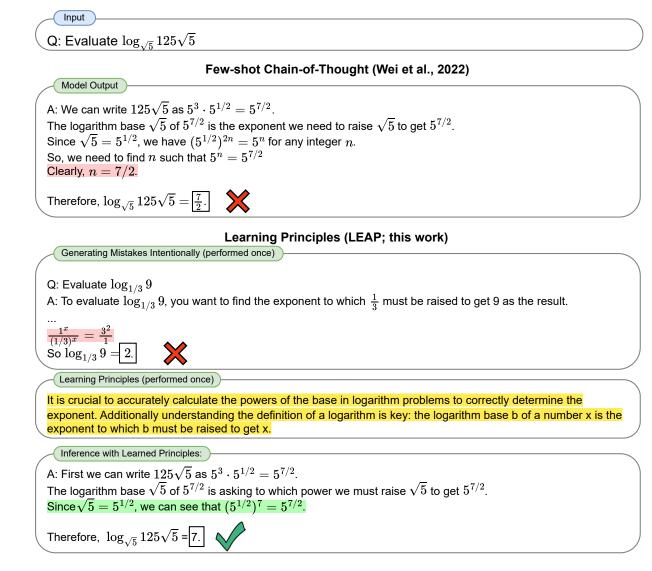

Figure 2: An illustration of LEAP: Given a few input-output examples, Chain-of-Thought (left) generates a response to the test question by directly learning from the (correct) examples. In contrast, Learning Principles (LEAP, right) first (a) generates *mistaken* zero-shot Chain-of-Thought response for each given input-output example by sampling with a non-zero temperature; (b) generates explicit *principles* by providing the LLM with the mistaken COT along with the correct output; and finally (c) generates a response to the test question, by providing the LLM with both the given input-output examples *and the learned principles*. Note that steps (a) and (b) are performed once per task.

Chialvo & Bak, 1999; Edmondson, 1999). In fact, learning
from mistakes is also a fundamental concept of machine
learning, which goes back to classical work such as Wiener
(1948); Rosenblatt (1957) and Minsky & Papert (1969), but
is not utilized by current ICL and prompting methods.

Differently from machines, humans can often *verbalize* their mistakes and articulate explicit *principles*, or "lessons"; these principles can further help humans avoid these and similar mistakes in the future. Inspired by this ability and the benefits it provides, we propose Learning Principles (LEAP): A prompting approach for learning principles from mistakes, and then conditioning on these principles when responding to *other* inputs. Instead of providing the model *only* with the given (correct) few-shot examples, LEAP begins by (a) inducing the LLM to *make mistakes* on each of these given few-shot inputs, in a zero-shot fashion, by sampling outputs with a non-zero temperature; (b) generating explicit *principles* by providing the same LLM with the mistaken outputs along with the correct output; and finally (c) generating a response to the test question as in standard few-shot ICL, while providing the LLM with both the given

10 input-output examples and the learned principles. LEAP

is illustrated in Figure 2; examples for some of the learnedprinciples are provided in Figure 1.

113 Crucially, LEAP does not require any more input than the 114 standard few-shot prompting settings. Further, the princi-115 ple learning step is applied *once* for a task, and then the 116 same learned principles are used for the entire test set. If 117 the few-shot examples are given as Chain-of-Thought (CoT; 118 Wei et al., 2022c), LEAP is applied seamlessly by generat-119 ing mistaken chains-of-thought, contrasting them with the 120 correct chains-of-thought, and generating principles. 121

122 We demonstrate the effectiveness of LEAP across a wide range of reasoning benchmarks, including mathematical 124 reasoning in GSM8K (Cobbe et al., 2021) and MATH 125 (Hendrycks et al., 2021), multi-hop question answering 126 tasks in HotpotQA (Yang et al., 2018b), textual reason-127 ing in DROP (Dua et al., 2019a), and 27 Big-Bench Hard 128 (Suzgun et al., 2022) tasks. LEAP outperforms the stan-129 dard practice of few-shot prompting using strong models 130 such as GPT-3.5-turbo, GPT-4, GPT-4-turbo and 131 Claude-2.1, with and without Chain-of-Thought. For 132 example, LEAP improves over the standard few-shot CoT 133 using GPT-4 by 7.5% in DROP, by 3.3% in HotpotQA, and 134 on 16 tasks in Big-Bench Hard. These results suggest that 135 LEAP revolutionizes the "traditional" concept of few-shot 136 ICL, by leveraging the recently emerged abilities of LLMs 137 to follow instructions (Mishra et al., 2021; Wei et al., 2022a; 138 Ouyang et al., 2022) and explain mistakes given the cor-139 rect answer or feedback (Madaan et al., 2023; Chen et al., 140 2023).

¹⁴²143**2. Background: In-Context Learning**

144 In-context learning, also known as few-shot prompting, uses 145 a few (typically between 3 and 8) input-output task-specific 146 examples for teaching a pre-trained LLM to solve a down-147 stream task (Brown et al., 2020; Liu et al., 2021; 2023). These input-output pairs $\mathcal{P} = \{(x_i, y_i)\}_{i=1}^k$ are concate-148 nated to form a prompt $p = \langle x_1 \cdot y_1 \rangle \oplus \langle x_2 \cdot y_2 \rangle \oplus \ldots \oplus \langle x_k \cdot$ 149 150 y_k , where "." denotes the concatenation of each input with 151 its corresponding output, and " \oplus " denotes the sequential 152 combination of these pairs. Then, every new test input x_{test} 153 is appended to this prompt, resulting in p $\oplus \langle x_{\text{test}} \cdot, \text{ which is} \rangle$ 154 then provided to the LLM. The LLM completes this input, 155 and generates the corresponding output \hat{y}_{test} .

Typically, the answer y additionally contains an explanation (or *thought*) for deriving the answer (Wei et al., 2022c). In these settings, each solution y contains a thought t and the final answer a, forming: $y_i = t_i \cdot a_i$, and the LLM is expected to generate the test-thought before generating the final test-answer: $t_{test} \cdot a_{test}$. In this work, we focus on this *chain-of-thought* setup, because of its widely demonstrated

164

141

effectiveness for reasoning tasks (Wang et al., 2022a; Wei et al., 2022c; Zhou et al., 2022; Wang et al., 2022b).

3. LEAP: Learning Principles from Mistakes

In LEAP, our goal is to learn general *principles* that help the model avoid potential mistakes in a downstream task. Given the few-shot examples $\mathcal{P} = \{\langle x_i, y_i \rangle\}_{i=1}^k$ for a certain task, we start by generating *mistakes* to the few given examples.

Generating Mistakes For each input-output pair $\langle x_i, y_i \rangle \in \mathcal{P}$, we generate a diverse set of solutions in a zero-shot fashion. Specifically, we follow Kojima et al. (2022), and create a zero-shot chain-of-thought prompt using x_i and the phrase *Think step-by-step*. For each input x_i , we sample n = 15 outputs with a non-zero temperature, producing a varied set of potential solutions $\{\hat{y}_i^j\}_{j=1}^n$ for each example x_i , such that $\hat{y}_i^j = \hat{t}_i^j \cdot \hat{a}_i^j$, where \hat{t}_i^j represents the intermediate reasoning steps (thoughts), and \hat{a}_i^j denotes the final answer.

We identify *incorrect* solutions by comparing each \hat{a}_i^j with the ground-truth answer a_i (which is given as part of the task), forming a set of mistakes for each $\langle x_i, y_i \rangle \in \mathcal{P}$ pair: $\mathcal{M}_i = \left\{ \left(x_i, y_i, \hat{y}_i^j \right) \right\}_{i=1}^{n'}$, such that $\forall j : \hat{a}_i^j \neq a_i$.

Generating Low-Level Principles Then, for each such mistake in \mathcal{M} , we prompt the LLM to generate a natural language explanation of the mistake. In this step, the LLM is provided with the ground truth answer y_i , to articulate the rationale behind the solution's inaccuracy, as illustrated in Figure 3. The insights of how to avoid these mistakes are aggregated across all examples to form a set of low-level principles, denoted as $\mathcal{L}_{\text{LOW-LEVEL}}$.

Generating High-Level Principles Subsequently, we use the LLM to condense the low-level principles into approximately 5 key bullet points, thus creating *high*-level principles, denoted as $\mathcal{L}_{\text{HIGH-LEVEL}}$. The motivation for this step is generating *generic*, example-agnostic, principles for solving the downstream task, that do not depend on mistakes made for any specific example.

Final Inference on Unseen Examples These principles, either low or high-level, are then appended to the prompt p, forming enhanced prompts: $p_{\text{LOW-LEVEL}} = \mathcal{L}_{\text{LOW-LEVEL}} \oplus p$ for low-level feedback, and $p_{\text{HIGH-LEVEL}} = \mathcal{L}_{\text{HIGH-LEVEL}} \oplus p$ for high-level feedback, where p is the prompt constructed using the standard concatenation of the few-shot examples, as described in Section 2.

Finally, we use the enhanced prompts $p_{\text{LOW-LEVEL}}$ or $p_{\text{HIGH-LEVEL}}$ for answering all unseen examples in the test set. In effect, the one-time process of generating principles

Question: {question}
Question: {question}
Generated Reasoning: {response}
Generated Answer: {generated_answer}
Correct Reasoning: {correct_reasoning}
Correct Answer: {correct_answer}
Instruction: Conduct a thorough analysis of the generated answer in comparison to the
correct answer. Also observe how the generated reasoning differs from the correct
reasoning. Identify any discrepancies, misunderstandings, or errors. Provide clear
insights, principles, or guidelines that can be derived from this analysis to improve
future responses. We are not focused on this one data point, but rather on the general
principle.
Reasoning: <discuss why the generated answer is wrong>
Insights: <what principle should be looked at carefully to improve the performance in
the future>

Figure 3: LEAP prompt to help LLM evaluate its own generated reasoning and answers, contrasting them with the correct reasoning and answers. The LLM is prompted to identify errors in its reasoning and extract key insights for improvement. This figure specifically represents the 'GenerateExplanation' step in the LEAP algorithm (Algorithm 1).

helps learn and *articulate* insights from the model's previous mistakes, potentially improving its accuracy and reasoning capabilities in future responses for *other* inputs.

The complete algorithm is summarized in Algorithm 1. Although different LLMs can be used for each step, in all our experiments, we fixed the LLM across all steps: generating mistakes, generating principles from those mistakes, and testing using these self-generated principles. This ensures that the difference in results arises only from LEAP rather than any kind of model ensemble or teaching.

4. Evaluation

We evaluated LEAP across various reasoning tasks, including HotpotQA (Yang et al., 2018b), DROP (Dua et al., 2019a), MATH (Hendrycks et al., 2021), GSM8K (Cobbe et al., 2021), and Big-Bench Hard (Suzgun et al., 2022). We follow the standard few-shot Chain-of-Thought (COT); we apply LEAP on top of few-shot CoT using the exact same number of labeled examples. Importantly, principles are generated *once* for every LLM and benchmark.

4.1. Experiment Setup

Compared Approaches Our baseline is the standard Fewshot prompting with COT . We compare this baseline with two variants of our proposed approach LEAP:

• LEAP HIGH-LEVEL is our proposed approach, as described in Section 3.

• **LEAP** LOW-LEVEL is similar to LEAP HIGH-LEVEL, except that we skip the step of "Generating High-Level Principles", and test the models on the downstream task using the few-shot examples *and the low-level principles*, using $\mathcal{L}_{LOW-LEVEL}$ rather than $\mathcal{L}_{HIGH-LEVEL}$ (Section 3).

Benchmarks We used diverse reasoning benchmarks:

- **Textual Reasoning**: HotpotQA (Yang et al., 2018a) is a question-answering dataset of computational questions that require multi-hop reasoning. DROP (Dua et al., 2019b) is a reading comprehension dataset that requires numerical and logical reasoning over textual paragraphs; for evaluation, we randomly sampled 2000 questions from its dev set.
- Mathematical Reasoning: GSM8K (Cobbe et al., 2021) comprises a test set of 1,319 diverse grade school math word problems, curated by human problem writers. In MATH (Hendrycks et al., 2021), there are 5,000 diverse examples consisting of problems from mathematics competitions. These are the two most common mathematical reasoning benchmarks.
- **Big-Bench Hard** (Suzgun et al., 2022): contains 27 challenging tasks that test various reasoning capabilities of LLMs. We repeated every run 3 times with a temperature of zero and report the average.¹

¹Internal non-determinism causes different outputs even with a temperature of zero, but the variance was negligible.

Algorithm 1 LEAP Algorithm

Require: Few-shot examples $\mathcal{P} = \{\langle x_i, y_i \rangle\}_{i=1}^k$, a pretrained LLM, number of outputs per input *n*, high-temperature setting *T* 0: for each input-output pair $\langle x_i, y_i \rangle$ in \mathcal{P} do

Table 1: **Textual Reasoning results**: Accuracy in textual reasoning benchmarks. The best approach for each base LLM in each dataset is in **bold**; the second-best approach is <u>underlined</u>. We see a good performance boost by adopting LEAP with high-level feedback and low-level feedback. Almost all the models can benefit from the principles learned and fix their previous mistakes.

		GPT-3.5-turbo	GPT-4	GPT-4-turbo	Gemini Pro
	Few-shot CoT	29.10	36.35	38.10	28.25
HotpotQA	LEAP LOW-LEVEL	32.60	<u>39.30</u>	37.85	23.70
	$LEAP_{\rm HIGH-LEVEL}$	<u>30.35</u>	39.65	38.75	25.50
	Few-shot CoT	<u>63.20</u>	72.05	83.40	64.60
DROP	LEAP LOW-LEVEL	63.35	79.55	83.60	<u>67.15</u>
	$LEAP_{\rm HIGH-LEVEL}$	63.00	<u>78.60</u>	80.00	67.60

Models We evaluated LEAP across a wide range of base models, including GPT-3.5-turbo (version -0613), GPT-4 (version -0613), GPT-4-turbo (version -1106), Claude-2.1, and Gemini Pro (Gemini Team Google, 2023).

256 **Few-shot examples** In Big-Bench Hard, we used the COT 257 prompts from Suzgun et al. (2022) with three given exam-258 ples (3-shot) in each benchmark. In MATH and GSM8K, 259 we used the standard training examples from each dataset, with 3 examples for each. In DROP, we used 3 given ex-261 amples that we adopted from Least-to-Most (Zhou et al., 2022). In HotpotQA we used 6 examples from ReAct (Yao 263 et al., 2022) ("closed-book"). Importantly, in each bench-264 mark, the exact same few-shot examples were used across 265 all evaluated approaches, including the baseline and LEAP. 266 Our complete prompts are provided in Appendix G. 267

4.2. Textual Reasoning Results

Table 1 shows the results on DROP and HotpotQA. As shown, LEAP improves over the Few-shot COT baseline by up to 3.5% on Hotpot QA and 7.5% on DROP. In HotpotQA, GPT-3.5-Turbo and GPT-4 are consistently improved when

using LEAP. In DROP, GPT-4 is significantly improved by LEAP (an absolute gain of 7.5%), Gemini Pro is improved by 3%, while the improvement for GPT-3.5-Turbo and GPT-4-turbo are more minor.

In most tasks and base models, both LEAP _{LOW-LEVEL} and LEAP _{HIGH-LEVEL} improve over the Few-shot COT baseline. The only case where the Few-shot COT baseline performs better than both LEAP _{LOW-LEVEL} and LEAP _{HIGH-LEVEL} is in HotpotQA using Gemini Pro. Observing the low-level principles that Gemini Pro learned in HotpotQA (Table 41), we believe that the learned principles are correct and useful, but they are overly focused on the examples they were generated for, more verbose, and similar to each other. These hinder the principles (and the high-level principles generated from them) from generalizing to other examples. For *zero*-shot prompting using principles learned from few examples, additional results are shown in Appendix A.

4.3. Math Reasoning Results

Table 2 shows the results on MATH and GSM8K. As shown, in GPT-3.5-turbo and GPT-4, both LEAP _{LOW-LEVEL} and LEAP _{HIGH-LEVEL} outperform the Few-shot COT baseline. Claude-2 shows inconclusive results: in GSM8K, Few-

Table 3: Llama-2-chat-70B Results: Accuracy in MATH and GSM8K using Llama-2-chat-70B as the base LLM, while generating the principles either with Llama-2-chat-70B or GPT-4. Even when the principles are generated by GPT-4 (GPT-4 Critic), Llama-2-chat-70B does not leverage the learned principles, and does not improve over the baseline Few-shot CoT.

Llama-2-c	chat-70B as the base model, with:	Llama-2 Critic	GPT-4 Critic
	Few-shot CoT	52.5	52.5
GSM8K	LEAP LOW-LEVEL	50.6	49.8
	LEAP HIGH-LEVEL	47.0	51.0
	Few-shot CoT	16.2	16.2
MATH	LEAP LOW-LEVEL	13.8	12.9
	LEAP HIGH-LEVEL	14.2	13.8

shot COT performs better than LEAP; in MATH, LEAP
 HIGH-LEVEL achieves slightly higher accuracy than Few-shot
 COT . Gemini Pro also shows inconclusive results, where
 both LEAP LOW-LEVEL and LEAP HIGH-LEVEL outperform the
 baseline in GSM8K , but perform slightly worse in MATH.
 Additional results, for zero-shot prompting using principles
 learned from few examples, are shown in Appendix B.

Does leap work with open-source models? In our preliminary experiments with open-source models, LEAP did not improve over the few-shot COT baseline. While the open-source models *did* produce useful principles, the opensource models did not follow these principles at test time.

Table 3 shows some of these experiments with Llama-2chat-70B : we used Llama-2-chat-70B as the base model, but generated the principles using either Llama-2-chat-70B ("LLama-2 Critic") or with GPT-4 ("GPT-4 Critic"). As shown, even when the principles are generated by GPT-4 (which we assume to be useful), Llama-2-chat-70B does not manage to leverage them to generate better final responses with either LEAP LOW-LEVEL or LEAP HIGH-LEVEL .

In general, we believe that LEAP requires a base LLM with
strong enough instruction following and reflection capabilities; we believe that, unfortunately, most open-source
models are not as powerful as proprietary models yet.

4.4. Big-Bench Hard Results

Figure 4 shows the results on selected BBH tasks; results for the rest of the BBH tasks are shown in Table 7 in Appendix C. We selected tasks to Table 6 where the difference in results was the most meaningful: there were some tasks where GPT-4-0613 achieved 100% accuracy with *any* of the approaches, including both LEAP and the baseline.

As shown in Table 6, in 37 out of 42 combinations of task and LLM, one of LEAP $_{\rm LOW-LEVEL}$ or LEAP $_{\rm HIGH-LEVEL}$ outperforms the baseline Few-shot CoT . In 24 of the cases, both LEAP $_{\rm LOW-LEVEL}$ and LEAP $_{\rm HIGH-LEVEL}$ outperform the Few-shot CoT baseline. In two cases, the Few-shot CoT baseline performs equally to LEAP $_{\rm LOW-LEVEL}$; and in 3 cases the Few-shot baseline performs better than both LEAP $_{\rm LOW-LEVEL}$ and LEAP $_{\rm HIGH-LEVEL}$.

We could not identify any particular pattern as to which method should be used: LEAP $_{LOW-LEVEL}$ or LEAP $_{HIGH-LEVEL}$; it seems that this depends on the reasoning complexity of the task, the diversity across questions in the benchmark, and the quality of the principles that the LLM had managed to generate from the 3 given examples for that task. We thus suggest that in real-life scenarios, both approaches should be tested, and selected using a validation set. Additional results, for zero-shot prompting using principles learned

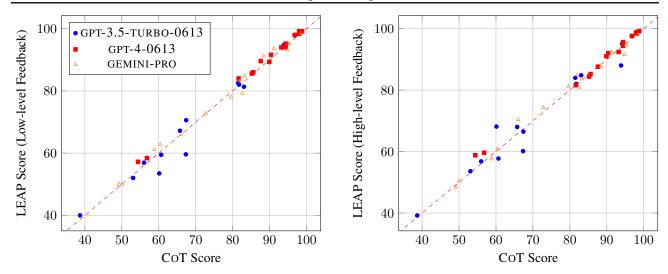

Figure 4: Accuracy in BBH tasks, across GPT-3.5-TURBO-0613, GPT-4-0613, and GEMINI-PRO. The figure presents the results using a scatter plot, where the y-axis represents scores achieved with LEAP, and the x-axis represents the baseline scores from CoT. Each task is represented by a point on the plot, with different shapes assigned to different models for easy distinction. Tasks above the y = x line are those where LEAP leads to an improvement in performance. Table 6 shows the detailed results for all 27 Big-Bench hard tasks. We find that in 37 out of 42 combinations of task and LLM, one of LEAP LOW-LEVEL or LEAP HIGH-LEVEL outperforms the baseline Few-shot COT.

from a few examples, are shown in Appendix C.

5. Qualitative Analysis

Figure 5 shows examples of questions from BBH, along with the task's learned principles, the baseline few-shot CoT response, and the LEAP _{LOW-LEVEL} response, all generated by GPT-3.5-turbo. The learned principle in each case is highlighted, along with the mistake in the CoT output and the correct reasoning generated by LEAP.

Additional examples are shown in Appendix D. The actual learned principles for some of the tasks and LLMs are provided in Tables 9-43 in Appendix E.

6. Related Works

This section focuses on the few works most related to ours. For a complete survey of relevant papers, see Zhao et al. (2023); Qiao et al. (2023); Kaddour et al. (2023); Xi et al. (2023); Zhang et al. (2023).

Comparison to Madaan et al. (2023) A related work to
ours is Self-Refine (Madaan et al., 2023), which, similarly
to LEAP, uses the LLM to reflect on its own previously
generated outputs. However, a significant difference from
Self-Refine is that applying Self-Refine to a test example
requires feedback *for that specific test example*; contrarily,
in this work, we show that principles that were learned from

some examples *generalize to other* test examples which we do not have feedback for. Further, Self-Refine uses "intrinsic self-correction", without any external feedback; as found by recent work (Huang et al., 2023a; Valmeekam et al., 2023), such intrinsic self-correction does not benefit *reasoning* tasks. In contrast, in this work, we show that the external signal provided by as few as 3 examples is sufficient for effective self-reflection in reasoning if these are used to articulate explicit learned principles. Another related work is MemPrompt (Madaan et al., 2022), which stores feedback on mistakes in a memory, and retrieves relevant feedback for a new query; in contrast, LEAP is a one-time process that does not require continuous storage and retrieval.

Comparison to Yang et al. (2023) Optimization by PROmpting (OPRO) (Yang et al., 2023) uses LLMs to improve zero-shot prompts, and both OPRO and LEAP can be thought of as ways of improving a prompt for a specific task. However, applying OPRO for prompt optimization requires a *training set*, which can be as large as \sim 260 examples for GSM8K; in contrast, LEAP requires only 3 labeled examples. Further, OPRO calls the LLM for each of these \sim 260 examples in each step; while the number of steps can be as low as 6, it can also be as high as 107. This results in between \sim 1500 calls and up to $107 \times 260 \approx 27,000$ inference calls to the LLM. In contrast, LEAP uses only about 34 inference calls: 3 calls to generate mistakes; one call for each mistake to generate low-level principles, which results in about 30 calls; and a final call to generate high-level

In-Context Principle Learning from Mistakes

385 386 Boolean Expressions (BBH)	Object Counting (BBH)
9367 387 388 388 	Question: I have a flute, a piano, a trombone, four stoves, a violin, an accordion, a clarinet, a drum, two lamps, and a trumpet. How many musical instruments do I have? Task Principles: The response should be directly related to the user's query or statement. Irrelevant information can confuse the user and detract from the overall quality of the response Few-shot CoT: Let's think step by step. We first identify the musical instruments on the list and include their quantity in parentheses: - flute (1) - piano (1) - trombone (1) - stoves (4) - violin (1) - accordion (1) - clarinet (1) - drum (1) - lamps (2) - trumpet (1) Now, let's add the numbers in parentheses: $1 + 1 + 1 + 4 + 1 + 1 + 1 + 2 + 1 = 14$. So the answer is 14 . X LEAP LOW-LEVEL Response: Let's think step by step. We first identify the musical instruments on the list and include their quantity in parentheses: - flute (1) - piano (1) - trombone (1) - violin (1) - accordion (1) - clarinet (1) - drum (1) - lamps (2) - trumpet (1) Now, let's add the numbers in parentheses: $1 + 1 + 1 + 1 + 1 + 1 + 1 + 1 + 1 + 1 $

Figure 5: Examples from the Boolean Expressions (left) and Object counting (right) tasks from BBH. The learned principle is highlighted in yellow, the mistaken step of the baseline is highlighted in red, and the correct use of the principle by LEAP is highlighted in green. This demonstrates how the learned principles guide LEAP in generating a better answer.

principles. Moreover, like OPRO, LEAP can also improve 411 zero-shot prompting by learning principles from a few ex-412 amples and applying them in a zero-shot fashion, as we 413 show in Appendix A, Appendix B, and Appendix C. For ex-414 ample, Zero-shot-LEAP improves the strong GPT-4 model 415 by 1% on GSM8K (Table 5). Similarly, EvoPrompt (Guo 416 et al., 2023) requires around 10,000 LLM inference calls, 417 which is also several orders of magnitude more than LEAP. 418 Other related approaches are AutoPrompt (Shin et al., 2020), 419 STaR (Zelikman et al., 2022), LMSI (Huang et al., 2023b), 420 and Self-Align (Sun et al., 2023) but these are based on 421 training the LLM, which is often either inaccessible or 422 computationally infeasible. 423

Comparison to Chia et al. (2023) Contrastive Chain-of-Thought (Chia et al., 2023) shares a similar motivation with our work: learning from negative in-context examples instead of learning only from positive examples. However, when we reproduced their results, we found that simple improvements to the post-processing code of extracting the final answer out of the LLM's raw output led to differences of more than 10 absolute points from their reported results in GSM8K, which made the proposed Contrastive CoT approach perform similarly or worse than the baseline few-shot CoT . We thus believe that generating *explicit* principles, as in LEAP, is the key ingredient in learning from negative in-context examples.

7. Conclusion

In this paper, we introduce Learning Principles (LEAP), a novel approach that allows LLMs to learn *more* out of given few-shot examples, by intentionally making mistakes on these examples; reflecting on the mistakes; and finally articulating explicit task-specific principles, which helps avoid similar mistakes in the future. LEAP requires exactly the same number of labeled examples as fewshot prompting, and allows improving a variety of strong LLMs (GPT-3.5-turbo, GPT-4, GPT-4-turbo and Gemini Pro) across a broad range of reasoning tasks (DROP, HotpotQA, GSM8K, MATH, and Big-Bench Hard). We believe that LEAP unlocks new possibilities from learning in the traditional concept of few-shot in-context learning, by learning from *mistakes*, rather than learning from positive examples only.

8. Broader Impact

This paper aims to advance the field of Machine Learning by presenting a method that allows LLMs to learn from their own mistakes. The potential of LLMs to learn to correct their behaviors from past mistakes can significantly improve their capability without human-in-the-loop. This ability has many potential societal consequences, most notably the opportunity for LLMs to self-improve across a wide range of tasks where their initial performance may be lacking

Table 8: Efficacy of LEAP Methods Across Various Tasks. This table provides an overview of the effectiveness of LEAP
in modifying the correctness of responses across a range of tasks. It highlights the number of instances where answers
changed from wrong to correct, correct to wrong, and the stability of responses (both correct and incorrect). Notable gains
in tasks like 'temporal_sequences' and 'snarks' suggest significant improvements, whereas tasks like 'ruin_names' and
'geometric_shapes' show areas needing further methodological refinement.

Table 6: BBH Results: Accuracy in BBH tasks, across GPT-3.5-turbo, GPT-4, and Gemini Pro. The best approach for each base LLM in each tasks is in **bold**; the second-best approach is <u>underlined</u>. Each number represents the average across 3 identical runs with a temperature of zero.

D. Additional Qualitative Analysis

Object Counting

Question: I have a flute, a piano, a trombone, four stoves, a violin, an accordion, a clarinet, a drum, two lamps, and a trumpet. How many musical instruments do I have?

Principles: Focus on relevance: The response should be directly related to the user's query or statement. Irrelevant information can confuse the user and detract from the overall quality of the response. ...

CoT Response: Let's think step by step. We first identify the musical instruments on the list and include their quantity in parentheses: - flute (1) - piano (1) - trombone (1) - stoves (4) - violin (1) - accordion (1) - clarinet (1) - drum (1) - lamps (2) - trumpet (1) Now, let's add the numbers in parentheses: 1 + 1 + 1 + 4 + 1 + 1 + 1 + 1 + 2 + 1 = 14. So the answer is 14. X

LEAP LOW-LEVEL **Response:** Let's think step by step. We first identify the musical instruments on the list and include their quantity in parentheses: - flute (1) - piano (1) - trombone (1) - violin (1) - accordion (1) - clarinet (1) - drum (1) - trumpet (1) Now, let's add the numbers in parentheses: 1 + 1 + 1 + 1 + 1 + 1 + 1 = 8. So the answer is $8 \cdot 4$

Salient Translation Error Detection

Question: The following translations from German to English contain a particular error. That error will be one of the following types: Named Entities, Numerical Values, Modifiers or Adjectives, Negation or Antonyms, Facts, Dropped Content. Please identify that error. Source: Neu Fahrland ist ein Ortsteil von Potsdam. Translation: Neu Fahrland is a district of Pots. The translation contains an error pertaining to Options: (A) Modifiers or Adjectives (B) Numerical Values (C) Negation or Antonyms (D) Named Entities (E) Dropped Content (F) Facts

Principles: When analyzing translations, it is important to carefully consider the translation of named entities. Any changes or inaccuracies in the translation of names, places, or other entities should be identified as named entity errors. **CoT Response:** Let's think step by step. We solve this question by first translating the source sentence to English and then by comparing our translation with the provided translation. According to Google Translate, the correct translation of the source sentence from German to English is "Neu Fahrland is a district of Potsdam." On the other hand, the provided translation is "Neu Fahrland is a district of Pots." Note that the provided translation is missing the word "dam" at the end of Pots. Because a significant part of the translation is dropped, the translation contains an error

pertaining to Dropped Content. So the answer is |(E)|.

LEAP LOW-LEVEL **Response:** Let's think step by step. We solve this question by first translating the source sentence to English and then by comparing our translation with the provided translation. According to Google Translate, the correct translation of the source sentence from German to English is "Neu Fahrland is a district of Potsdam." On the other hand, the provided translation is "Neu Fahrland is a district of Pots." Note that the provided translation omits the word "dam" from Potsdam. Because a significant part of the entity name is removed in the translation, the translation

contains an error pertaining to Named Entities. So the answer is |(D)|.

In-Context Principle Learning from Mistakes

Boolean Expressions

Question: not not (False and not False) is

Principles: ... 3. Double negation, as in 'not not', cancels out and returns the original value. ...

CoT Response: Let's think step by step. Remember that (i) expressions inside brackets are always evaluated first and that (ii) the order of operations from highest priority to lowest priority is "not", "and", "or", respectively. We first simplify this expression "Z" as follows: "Z = not not (False and not False) = not not (A)" where "A = False and not False". Let's evaluate A: A = False and not False = False and True = False. Plugging in A, we get: Z = not not (A) = not not (False) = not not True = not False = True. So the answer is True.

LEAP LOW-LEVEL **Response:** Let's think step by step. Remember that (i) expressions inside brackets are always evaluated first and that (ii) the order of operations from highest priority to lowest priority is "not", "and", "or", respectively. We first simplify this expression "Z" as follows: "Z = not not (False and not False) = not not (A)" where "A = False and not False". Let's evaluate A: A = False and not False = False and True = False. Plugging in A, we get: Z = not not (A) = not not (False) = not not False = False. So the answer is False.

Snarks

Question: Which statement is sarcastic? Options: (A) It's not our job to fund education! It should be the government paying the maintenance to keep schools open (B) It's not our job to fund education! It should be the kids paying the maintenance to keep schools open

Principles: To improve future responses, it is important to carefully consider the context and tone of the statements when identifying sarcasm. Sarcasm often involves saying the opposite of what is meant ... Paying attention to the incongruity between the literal meaning of the words and the intended meaning can help in accurately identifying sarcasm.

CoT Response: Let's think step by step. If we look at (A), it suggests that funding education is not the responsibility of the speaker or the people, but rather the government. This statement is often used sarcastically to criticize individuals or groups who do not prioritize or support funding for education. If we look at (B), it suggests that funding education is not the responsibility of the speaker or the people, but rather the kids. This statement is not typically used sarcastically

and can be seen as a genuine belief or opinion. Above the above, the sarcastic option is (A). So the answer is (A). **X LEAP**_{LOW-LEVEL} **Response:** Let's think step by step. If we look at (A), it suggests that it is not the responsibility of the speaker or their group to fund education, and instead, it should be the government's responsibility. This statement aligns with the commonly accepted understanding that education funding is a shared responsibility between individuals, communities, and the government. Therefore, (A) does not appear to contain sarcasm. If we look at (B), it suggests that it is not the responsibility of the speaker or their group to fund education, and instead, it should be the kids' responsibility. This statement contradicts the generally accepted understanding that children should not be burdened with the financial responsibility of maintaining schools. The presence of such a contradiction in (B) suggests that it

contains a taste of irony and sarcasm. Above the above, the sarcastic option is (B). So the answer is |(B)|.

Question: May 6, 1992 is like vesterday to Jane, but that is actually ten years ago. What is the date one week ago from today in MM/DD/YYYY? Options: (A) 04/29/2002 (B) 04/24/2002 (C) 04/19/2002 (D) 04/28/2002 (E) 02/13/2002

Principles: ... When subtracting days from a given date, it is important to accurately calculate the number of days to

CoT Response: Let's think step by step. If May 6, 1992 is like yesterday to Jane, but that is actually ten years ago,

LEAP LOW-LEVEL Response: Let's think step by step. If May 6, 1992 is ten years ago, then today's date is May 6, 2002.

then today's date is May 16, 2002. One week ago from today is May 9, 2002. So the answer is |(D)|.

One week ago from today is April 29, 2002, that is 04/29/2002. So the answer is |(A)|.

subtract and perform the subtraction correctly....

(F) 05/20/2002

Multistep Arithmetic Two
Question: $((5 - 6 - 7 + 6) - (-1 - 1 * -7 + 9)) =$
Principles: It is crucial to pay attention to the signs and operations when simplifying expressions inside parentheses. Any mistake in this step can lead to incorrect results.
CoT Response: Let's think step by step. Let's recall that the order of operations in mathematics is as follows: (1)
Parentheses, (2) exponents, (3) multiplication and division (from left to right), (4) addition and multiplication (from
left to right). So, remember to always compute the expressions inside parentheses or brackets first. This equation can be written as "A - B", where A = $(5 - 6 - 7 + 6)$ and B = $(-1 - 1 * -7 + 9)$. Let's calculate A = $(5 - 6 - 7 + 6) = (5 - (6 - 7))$
+ 6) = (5 - (-1) + 6) = (5 + 1 + 6) = 12. Let's calculate $B = (-1 - 1 * -7 + 9). $ Let's calculate $A = (5 - 6 - 7 + 6) = (5 - (6 - 7) + 6) = (-1 + 7 + 9) = (-1 + 7$
the final equation is A - B = 12 - 15 = -3. So the answer is $\boxed{-3}$.
LEAP LOW-LEVEL Response: A: Let's think step by step. Let's recall that the order of operations in mathematics
is as follows: (1) Parentheses, (2) exponents, (3) multiplication and division (from left to right), (4) addition and
multiplication (from left to right). So, remember to always compute the expressions inside parentheses or brackets first. This equation can be written as "A - B", where $A = (5 - 6 - 7 + 6)$ and $B = (-1 - 1 * -7 + 9)$. Let's calculate $A = (5 - 6 - 7 + 6)$ and $B = (-1 - 1 * -7 + 9)$.
-6 - 7 + 6) = (5 - 6 - 7 + 6) = (-1 - 7 + 6) = (-8 + 6) = -2. Let's calculate B = $(-1 - 1 * -7 + 9) = (-1 - (-7) + 9) = (-1 + 7 + 9)$

9) = (6 + 9) = 15. Then, the final equation is A - B = -2 - 15 = -17. So the answer is -17.

Disambiguation QA

Question: In the following sentences, explain the antecedent of the pronoun (which thing the pronoun refers to), or state that it is ambiguous. Sentence: The undergraduate applied to work with the scientist because he needed a lab assistant. Options: (A) The undergraduate needed an assistant (B) The scientist needed an assistant (C) Ambiguous **Principles:** Pay attention to the causality and context of the sentence to identify the most likely referent for the pronoun. It is not enough to simply assume that the pronoun could refer to any possible noun mentioned in the sentence.

CoT Response: Let's think step by step. Here we need to determine who the pronoun "he" might be referring to. There are two possible referents for "he", namely the undergraduate and the scientist. The verb "applied" might be able to help us determine which one is more likely (if either). Let X be the undergraduate and Y the scientist. The sentence is then of the form "X applied to work with Y because (X or Y) needed a lab assistant." Let's consider Y first: "X applied to work with Y because Y needed a lab assistant." This case makes sense, because X applied to work with Y because Y had a need for a lab assistant. Now, consider X: "X applied to work with Y because X needed a lab assistant." This case also makes sense, because X applied to work with Y because X had a need for a lab assistant. Because both X and Y are possible at the same time, we conclude that the antecedent of the pronoun is ambiguous. So the answer is |(C)|. LEAP LOW-LEVEL Response: Let's think step by step. Here we need to determine who the pronoun "he" might be referring to. There are two possible referents for "he", namely the undergraduate and the scientist. The verb "applied" might be able to help us determine which one is more likely (if either). Let X be the undergraduate and Y the scientist. The sentence is then of the form "X applied to work with Y because (X or Y) needed a lab assistant." Let's consider Y first: "X applied to work with Y because Y needed a lab assistant." This case makes sense, because X wanted to work with Y because Y needed assistance in the lab. Now, consider X: "X applied to work with Y because X needed a lab assistant." This case doesn't make much sense, because X, as an undergraduate, would typically be the one seeking an opportunity to work with a scientist, not the other way around. Because in this context, X is the

undergraduate and Y is the scientist, the answer should be the scientist. So the answer is |(B)|.

1100 E. Learned Principles

1101 Tables 9-39 show the high-level principles learned by LEAP. Tables 40-43 show low-level principles learned by LEAP. 1102 1103 High-level principles (LEAP HIGH-LEVEL) learned by LEAP for boolean expressions (BBH) using GPT-4-0613 1104 1105 1. Ensure clarity and conciseness: Responses should be clear and concise to avoid confusion and maintain 1106 the user's interest. 1107 2. Avoid redundancies: Redundant information should be eliminated to maintain the user's attention and 1108 improve the efficiency of communication. 1109 3. Maintain uniqueness: Each response should be unique to keep the user engaged and provide a personalized 1110 experience. 1111 4. Incorporate feedback: User feedback should be analyzed and incorporated into future responses to improve 1112 the quality of interaction. 1113 5. Focus on relevance: Responses should be directly related to the user's query or statement to maintain 1114 relevance and provide accurate information. 1115 6. Prioritize logical reasoning: Logical reasoning should be the foundation of all responses to ensure accuracy 1116 and credibility. 1117 7. Preserve specific details: Specific details provided by the user should be preserved in the response to show 1118 understanding and maintain context. 1119 8. Continual improvement: Regular introspection and analysis should be conducted to continually improve 1120 the quality of responses. 1121 1122 Table 9 1123 1124 1125 High-level principles (LEAP HIGH-LEVEL) learned by LEAP for causal judgement (BBH) using GPT-4-0613 1126 1. Consider all relevant details in the scenario: Ensure that all key details are taken into account when 1127 forming a conclusion. Do not overemphasize certain details at the expense of others. 1128 2. Understand the concept of intentionality: It's not enough to initiate an action; the action must be carried 1129 out as planned for it to be considered intentional. 1130 3. Consider all factors in a scenario: This includes the actor's control over the situation and the predictability 1131 of the outcome when determining intentionality. 1132 4. Distinguish between the intent to perform an action and the intent to cause a specific outcome: In questions 1133 of causation, it's important to understand these nuances to provide accurate analysis. 1134 5. Understand the context of causation: Intentionality involves not just the initial action but also the control 1135 and predictability of the outcome. 1136 6. Avoid overemphasis on initial decisions: The initial decision to perform an action should not be 1137 overemphasized at the expense of other factors, such as the accidental nature of the outcome. 1138 7. Improve understanding and interpretation of intent: This includes understanding the difference between 1139 the intent to perform an action and the intent to cause a specific outcome. 1140 8. Ensure adequate consideration of crucial factors: In any scenario, ensure that all aspects, especially those 1141 that are crucial to the outcome, are adequately considered before arriving at a conclusion. 1142 1143 Table 10 1144 1145 1146 1147 1148 1149 1150 1151 1152 1153 1154

1155 1156 1157 1158 1159 High-level principles (LEAP HIGH-LEVEL) learned by LEAP for date understanding (BBH) using GPT-4-0613 1160 1. Ensure clarity and precision: Responses should be clear and concise, avoiding any ambiguity or unneces-1161 sary complexity. 1162 2. Maintain relevance: The responses should be directly related to the query or topic at hand, avoiding any 1163 irrelevant information. 1164 3. Avoid redundancy: Each response should provide unique information, avoiding repetition of previously 1165 stated facts or ideas. 1166 4. Prioritize understanding: The responses should be designed to enhance the user's understanding of the 1167 topic, rather than simply providing information. 1168 5. Foster engagement: The responses should be engaging and interactive, encouraging further dialogue and 1169 exploration of the topic. 1170 6. Promote logical reasoning: The responses should be logically sound and well-reasoned, demonstrating a 1171 clear thought process. 7. Respect user's perspective: The responses should respect the user's perspective and knowledge level, 1173 avoiding any condescension or oversimplification. 1174 8. Incorporate feedback: The responses should incorporate feedback from previous interactions, continuously 1175 improving in quality and relevance. 1176 1177 Table 11 1178 1179 1180 1181 1182 1183 1184 1185 1186 1187 High-level principles (LEAP HIGH-LEVEL) learned by LEAP for disambiguation qa (BBH) using GPT-4-0613 1188 1. The system should consider all possible interpretations of a sentence when determining the antecedent of 1189 a pronoun. 1190 1191 2. In ambiguous cases, the system should recognize the ambiguity and avoid making assumptions. 1192 3. The system should consider the context and logical flow of information in the sentence to accurately 1193 determine the antecedent of a pronoun. 1194 4. The system should improve its understanding of how information is typically exchanged in conversations 1195 or narratives. 1196 5. The system should understand the dynamics of a conversation and the flow of information to interpret 1197 pronouns correctly. 1198 6. The system should consider the likelihood of each potential antecedent based on the structure and 1199 semantics of the sentence. 1200 7. The system should pay closer attention to the context and the logical sequence of events in the sentence. 8. The system should consider the roles and actions of the subjects in the sentence to accurately determine the antecedent of the pronoun. 1204 Table 12 1205 1206 1207 1208

1210 1212 1213 High-level principles (LEAP HIGH-LEVEL) learned by LEAP for dyck languages (BBH) using GPT-4-0613 1214 1215 1. Improve understanding of the rule that parentheses must be closed in the reverse order they were opened, 1216 which is fundamental in programming and mathematics. 1217 2. Enhance the method of analyzing sequences of parentheses by processing each input one by one and 1218 keeping track of the stack configuration. 1219 3. Train the model to recognize that different types of parentheses (e.g., square brackets, curly brackets, 1220 round brackets) must be matched with their corresponding closing parentheses. 1221 4. Improve the model's ability to track the opening and closing of parentheses in a sequence and identify the 1222 ones that are still open at the end of the sequence. 1223 5. Develop a more detailed understanding of the rules of parentheses and the ability to apply these rules to a 1224 given sequence. 1225 6. Train the model to understand and apply the Last In, First Out (LIFO) principle when dealing with 1226 problems related to sequences, particularly those involving brackets or parentheses. 1227 7. Ensure the model understands that the sequence ends when all brackets are properly closed, not when all 1228 opening brackets have been matched with a closing bracket. 1229 8. Enhance the model's ability to correctly balance sequences of parentheses. 1230 1231 Table 13 1232 1233 1234 1235 1236 1237 1238 1239 1240 High-level principles (LEAP HIGH-LEVEL) learned by LEAP for formal fallacies (BBH) using GPT-4-0613 1241 1242 1. Ensure clarity and precision: Responses should be clear and concise, avoiding any ambiguity or unneces-1243 sary complexity. 1244 2. Maintain relevance: The responses should be directly related to the query or topic at hand, avoiding any 1245 irrelevant information. 1246 3. Avoid redundancy: Each response should provide unique information, avoiding repetition of previously 1247 stated facts or ideas. 1248 4. Prioritize understanding: The responses should be designed to enhance the user's understanding of the 1249 topic, rather than simply providing information. 5. Foster engagement: The responses should be engaging and interactive, encouraging further discussion or 1251 exploration of the topic. 1252 6. Uphold accuracy: The information provided in the responses should be accurate and reliable, based on 1253 verified sources or logical reasoning. 1254 7. Adapt to context: The responses should be tailored to the specific context of the conversation, taking into 1255 account the user's knowledge level, interests, and potential biases. 1256 8. Promote introspection: The responses should encourage the user to think critically and reflect on the information provided, fostering a deeper understanding and appreciation of the topic. 1258 1259 Table 14 1260 1261 1262 1264

In-Context Principle Learning from Mistakes

1266 1268 1269 High-level principles (LEAP HIGH-LEVEL) learned by LEAP for geometric shapes (BBH) using GPT-4-0613 1270 1. Improve the system's understanding of SVG path data and how it represents shapes. 1272 2. Recognize that the number of "L" commands in an SVG path corresponds to the number of sides in the shape. 1274 3. Understand that the "M" command in SVG path data moves the current point to a specified location 1275 without creating a line. 1276 4. Count the number of "L" commands to determine the number of sides in the shape. 1277 5. Recognize that the final "L" command that connects back to the initial "M" command completes the shape, 1278 and should not be counted as creating an additional side. 1279 6. Improve the system's ability to interpret when an SVG path starts and ends at the same point. 1280 7. Ensure that points that are visited more than once in the path, such as the starting point, are not double-1281 counted when determining the number of sides in the polygon. 1282 8. Develop a clear understanding of geometric shapes and their properties to accurately analyze and interpret 1283 SVG paths. 1284 1285 Table 15 1286 1287 1289 1290 1292 1294 1295 1296 High-level principles (LEAP HIGH-LEVEL) learned by LEAP for hyperbaton (BBH) using GPT-4-0613 1297 1. The system should have a comprehensive understanding of English grammar rules, including the correct 1298 order of adjectives. 1299 2. The system should be able to correctly apply the identified grammatical rules to sentence analysis. 1300 3. The system should be programmed to handle cases where not all categories of adjectives are present, recognizing that the order of the remaining adjectives is still important. 1302 4. The system should be able to cross-verify its understanding of rules with the given options to ensure 1303 accuracy. 1304 5. The system should be able to correctly identify the category each adjective falls into and ensure they are 1305 in the correct sequence. 1306 6. The system should be able to correctly compare and evaluate multiple options against these rules to 1307 identify the correct answer. 1308 7. The system should be improved to recognize and apply the correct adjective order of Opinion, Size, Origin, 1309 Purpose. 1310 8. The system should be able to recognize when an adjective category (like Age or Color) is missing, and still maintain the correct order for the remaining adjectives. 1313 Table 16 1314 1315 1316 1317 1318 1319

In-Context Principle Learning from Mistakes

1320 1321 1322 1323 High-level principles (LEAP HIGH-LEVEL) learned by LEAP for logical deduction five objects (BBH) using 1324 GPT-4-0613 1325 1. Enhance Interpretation Skills: The system should improve its ability to interpret and integrate multiple 1326 pieces of information accurately. 1327 2. Improve Spatial Understanding: The system should be able to visualize or map out the spatial arrangement 1328 of objects based on given descriptions. 1329 3. Understand Spatial Prepositions: The system should have a clear understanding of spatial prepositions 1330 and their implications in a given context. 1331 4. Enhance Inference Capabilities: The system should be able to infer information that is not explicitly stated but can be logically deduced from the given information. 5. Eliminate Redundancies: The system should focus on capturing the essence of the feedback while 1334 eliminating any redundancies. 1335 6. Maintain Clarity and Conciseness: Each point made by the system should be clear, concise, and directly 1336 derived from the introspection results. 7. Retain Specific Details: The system should retain specific details in its responses to ensure accuracy and 1338 completeness. 1339 8. Limit Principles: The system should limit its principles to a maximum of eight to maintain focus and 1340 effectiveness. 1341 1342 Table 17 1343 1344 1345 1346 1347 1348 1349 High-level principles (LEAP HIGH-LEVEL) learned by LEAP for logical deduction seven objects (BBH) using 1351 GPT-4-0613 1352 1353 1. Ensure clarity and precision: Responses should be clear and concise, avoiding any ambiguity or unneces-1354 sarv complexity. 1355 2. Maintain relevance: Responses should directly address the query or topic at hand, avoiding any unrelated 1356 or tangential information. 3. Prioritize uniqueness: Strive to provide unique insights or perspectives in responses, avoiding repetition or 1357 1358 common knowledge. 1359 4. Emphasize logical reasoning: Responses should be logically sound and well-reasoned, with each point 1360 building on the last to form a coherent argument or explanation. 1361 5. Eliminate redundancies: Avoid repeating the same information or points in a response, as this can dilute 1362 the message and make the response less engaging. 1363 6. Incorporate specific details: Where relevant, include specific details in responses to add depth and richness 1364 to the information provided. 1365 7. Limit response length: Keep responses to a reasonable length to ensure they are digestible and maintain 1366 the reader's interest. 1367 8. Continually improve: Regularly review and analyze responses to identify areas for improvement and 1368 implement changes as necessary. 1369 1370 Table 18 1371 1372 1373 1374

High-level principles (LEAP HIGH-LEVEL) learned by LEAP for logical deduction three objects (BBH) using GPT-4-0613 1. Ensure clarity and precision: Responses should be clear and concise, avoiding any ambiguity or unneces-sary complexity. 2. Maintain relevance: Responses should directly address the query or topic at hand, avoiding any unrelated or tangential information. 3. Prioritize uniqueness: Strive to provide unique insights or perspectives in responses, avoiding repetition or common knowledge. 4. Foster engagement: Responses should be engaging and interesting, aiming to stimulate further discussion or thought. 5. Uphold accuracy: Ensure all information provided is accurate and up-to-date, avoiding any misinformation or outdated facts. 6. Promote comprehensibility: Use language and terminology that is easily understood by the intended audience, avoiding jargon or overly complex language. 7. Encourage brevity: Keep responses succinct and to the point, avoiding unnecessary length or verbosity. 8. Respect context: Consider the context of the query or discussion when formulating responses, ensuring they are appropriate and relevant. Table 19 High-level principles (LEAP HIGH-LEVEL) learned by LEAP for movie recommendation (BBH) using GPT-4-1. Ensure Consistency in Labeling: Always cross-check the labels used in the reasoning process with those in the question to avoid discrepancies that could lead to incorrect conclusions. 2. Comprehensive Analysis: Consider all aspects of the subject matter, such as time period, cultural significance, and popularity, not just the most obvious or immediate ones. 3. Contextual Understanding: Always consider the broader context of the question to avoid focusing too narrowly on one aspect. This will help in generating more accurate and relevant answers. 4. Avoid Redundancies: Strive to eliminate any redundancies in the reasoning process to maintain clarity and precision. 5. Emphasize Uniqueness: Ensure that each principle is unique and offers a different perspective or approach to improve the reasoning process. 6. Clarity and Conciseness: Make sure each principle is clear, concise, and directly derived from the introspection results. 7. Detail Orientation: Do not omit specific details that could be crucial to the reasoning process. 8. Continuous Improvement: Regularly review and update the principles based on new insights or feedback to ensure continuous improvement in the reasoning process. Table 20

In-Context Principle Learning from Mistakes

High-level principles (LEAP $_{\text{HIGH-LEVEL}}$) learned by LEAP for HotpotQA using GPT-4-0613
1. Ensure comprehensive analysis of all relevant information, considering all aspects of the subject matter
not just the most prominent ones.
2. Improve categorization of work or field of study, understanding the hierarchical and categorical relation
ships between different fields.
3. Always conclude responses with a clear answer statement, such as "So the answer is <answer>".</answer>
4. Expand the range of accessible information to answer specific questions accurately.
5. Improve understanding of the topic at hand, pulling from a wider range of data if necessary.6. Recognize when a question is asking for a specific piece of information and strive to provide that.
7. Avoid defaulting to "unknown" when the answer isn't immediately apparent, instead, make an effort
find the required information.
8. Improve the ability to recognize and understand the background and inspirations of characters or subject
in various fields.
Table 39
Low-level principles (LEAP LOW-LEVEL) learned by LEAP for HotpotQA using GPT-4-0613
1. The principle that should be looked at carefully to improve the performance in the future is to ensure
comprehensive analysis of all the relevant information. In this case, all the professions of the individual
should have been considered, not just the most prominent one. This will help to provide a more accurate a
complete answer.
2. The system should be more careful when categorizing the type of work or field of study of individua
Even if their specific areas of focus or contributions differ, they may still belong to the same broader fie
or type of work. In this case, both individuals are mathematicians, so they are known for the same type
work. The system should be able to recognize and understand the hierarchical and categorical relationshi
between different fields of study or types of work.
3. Pay attention to the format! End your response with "So the answer is <answer>".</answer>4. The system should be able to access a broader range of information to answer specific questions accurate
In this case, it would need to know about the background and inspirations of Matt Groening's characters
'The Simpsons'. This suggests that the system needs to be able to pull from a wider range of data or have
more comprehensive understanding of the topic at hand. It's also important for the system to recognize wh
a question is asking for a specific piece of information and to strive to provide that, rather than defaulting
"unknown" when the answer isn't immediately apparent.
Table 40
Low-level principles (LEAP LOW-LEVEL) learned by LEAP for HotpotQA using Gemini Pro
1. When comparing the start dates of two entities, it is crucial to ensure the accuracy of the information use
Incorrect data can lead to erroneous conclusions. Always verify the accuracy of information before drawing
conclusions.
2. When answering questions about commonalities between two entities, it is important to consider
relevant aspects and not just the most obvious or prominent one. A comprehensive analysis of all share
characteristics is necessary to provide an accurate and complete answer.
3. When analyzing the work of mathematicians or scientists, it is important to consider the broader field
of study that their contributions belong to, rather than focusing solely on the specific subfields or top
that they worked on. This broader perspective allows for a more accurate assessment of the similarities a
differences in their work and helps to avoid incorrect conclusions about the nature of their contributions.
4. When answering questions about the professions of multiple people, it is important to consider all of t
professions that they have in common, not just the most prominent one.
Table 41

Low-level principles	(LEAP LOW-LEVEL) learned by LEAP for DROP using GPT-4-0613
 The system shoul have recognized that Community before i context and requirem The system should have recognized that ended in that year. U accurate answers. The system should the direct information in the passage. The information is direct 	d be designed to understand the context of the question better. In this case, is the question was asking for the duration of existence of the European Coal a transitioned into the European Economic Community. Understanding the transitioned into the European Economic Community. Understanding the transitioned to carefully interpret the context of the question. In this case, if the ECSC transformed into the EEC in 1958, and therefore, its existence as the inderstanding the context and specific details of the question is crucial for generating accurate answers. In this case, if the ECSC transformed into the EEC in 1958, and therefore, its existence as the inderstanding the context and specific details of the question is crucial for generating the total number of touchdown passes thrown by Stafford, which was clear system should not make unnecessary assumptions or calculations when the y provided. This will help to avoid errors and improve the accuracy of the an e format! Make sure your final answer should be a single numerical number, in
	end of your response.

Table 44: **BBH Results:** Comparative performance results on various BBH datasets using Llama-2-chat-70B . With Llama-2-chat-70B , LEAP underperforms vanilla CoT . An analysis of outputs reveals that the present of lessons causes Llama-2-chat-70B to hallucinate bad output at a dramatically high rates for some tasks. For example, instead of generating the answer, Llama-2-chat-70B + LEAP will start repeating the instructions to format the answer or start generating new samples. This indicates that instruction tuning for Llama-2-chat-70B might be brittle.

F. Open-Source Models Experiments

We also experimented with Llama-2-chat-70B to investigate how the open-access models perform with LEAP. We find mixed results in experimenting with Llama-2-chat-70B for LEAP. Specifically, we find that for BBH tasks, LEAP is ineffective in improving reasoning performance. The lessons generated by LEAP overwhelm Llama-2-chat-70B, indicating that the ability to follow and act on complex instructions might be the key.

2035 Instruction: {instruction} 2036 Question: {question} 2038 2039 End your answer with "So the answer is <answer>." 2040 Think step by step. 2041 2042 2043 Figure 6: Prompt template for the mistake generation step. 2044 2045 2046 **Question:** {question} 2047 2048 Generated Reasoning: {response} 2049 Generated Answer: {generated_answer} 2050 2051 **Correct Reasoning:** {correct_reasoning} 2052 Correct Answer: {correct_answer} 2054 2055 Instruction: Conduct a thorough analysis of the generated answer in comparison to the correct answer. Also observe how the generated reasoning differs from the correct 2056 reasoning. Identify any discrepancies, misunderstandings, or errors. Provide clear 2057 insights, principles, or guidelines that can be derived from this analysis to improve 2058 future responses. We are not focused on this one data point, but rather on the general 2059 principle. 2060 Reasoning: <discuss why the generated answer is wrong> 2061 Insights: <what principle should be looked at carefully to improve the performance in 2062 the future> 2063 2064 2065 Figure 7: Prompt template for the low-level principle learning step. 2066 2067 2068 Low-level principles: {low_level_principles} 2069 Create a list of *unique* and insightful principles to improve future responses based on the analysis above. 2071 Focus on capturing the essence of the feedback while eliminating redundancies. 2072 Ensure that each point is clear, concise, and directly derived from the introspection 2073 results. Create a numbered list of principles. Leave specific details in place. 2074 Limit to at most 8 principles. 2075 2076 List of Principles: 2078 2079 Figure 8: Prompt template for the high-level principle learning step. 2080 2081 G. Prompts 2083 This section contains the prompts for the different steps in LEAP: Figure 6 shows the prompt template for the first step of 2084 generating mistakes; Figure 7 shows the prompt template for the second step of generating low-level principles ($\mathcal{L}_{LOW-LEVEL}$); 2085 Figure 8 shows the prompt template for the third step of generating high-level principles ($\mathcal{L}_{\text{HIGH-LEVEL}}$); finally, Figure 9 2086 shows the prompt template for the final inference on unseen examples. 2087
